XD series PLC expansion module

User Manual

KALATEC AUTOMAÇÃO LTDA
www.kalatec.com.br

This manual includes some basic precautions which you should follow to keep you safe and protect the products. These precautions are underlined with warning triangles in the manual. About other manuals that we do not mention please follow basic electric operating rules.

Precautions

Please follow the precautions. If not, it may lead the control system incorrect or abnormal, even cause fortune lose.

Correct Application

The models could only be used according to the manual, and an only be used along with the peripheral equipment recognized or recommended by X Company. They could only work normally in the condition of be transported, kept and installed correctly, also please operate and maintain them according to the recommendation.

Duty Declare

We have checked the manual; its content fits the hardware and software of the products. As mistakes are unavoidable, we couldn't promise all correct. However, we would check the data in the manual frequently, and in the next edition, we will correct the necessary information. Your recommendation would be highly appreciated

Catalog

1. Modules introduction

1-1. Module type and configuration

XD series PLCs not only have strong functions of logic operation, data operation, high speed processing etc. but also A/D, D/A conversion, PID function. With the expansions of analog input module, analog output module, temperature control module etc. XD series PLCs are widely used in the control system of temperature, flow, liquid level, pressure.

1-1-1. Module type and names

The detailed information is:

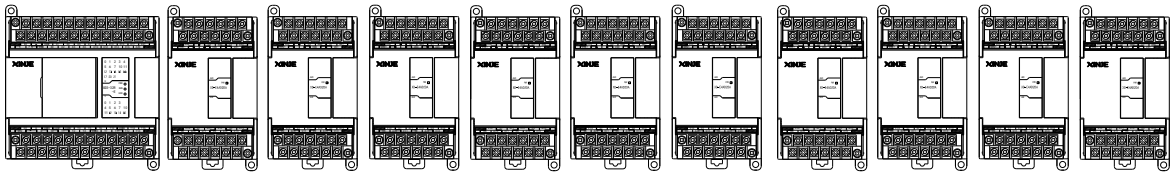
Model	Function
XD-EnXmY	N points input, m points output, PNP/NPN input, relay/transistor output
XD-E4AD2DA	4 channels analog input (14bits); 2 channels analog output (12bits); input and output are all current/voltage selectable
XD-E4AD2DA-B	4 channels analog input (14bits), current/voltage selectable; 2 channels voltage output (12bits), -10V~10V, -5V~5V selectable;
XD-E4AD	4 channels analog input (14 bits), current/voltage selectable
XD-E8AD	8 channels analog input (14 bits), current/voltage selectable
XD-E2DA	2 channels analog output (12 bits), current/voltage selectable
XD-E4DA	4 channels analog output (12 bits), current/voltage selectable
XD-E1WT-A	1 channel pressure control module, detection range DC -39.06mV~39.06mV
XD-E2WT-A	2 channel pressure control module, detection range DC -39.06mV~39.06mV
XD-E4WT-A	4 channel pressure control module, detection range DC -39.06mV~39.06mV
XD-E2WT-B	2 channel pressure control module, detection range DC 0mV~10mV
XD-E1WT-C	1 channel pressure control module, detection range DC 0mV~10mV
XD-E2WT-C	2 channel pressure control module, detection range DC 0mV~10mV
XD-E4WT-C	4 channel pressure control module, detection range DC 0mV~10mV
XD-E1WT-D	1 channel pressure control module, detection range DC 0mV~10mV
XD-E2WT-D	2 channel pressure control module, detection range DC 0mV~10mV
XD-E4WT-D	4 channel pressure control module, detection range DC 0mV~10mV
XD-E6PT-P	6 channels PT100 temperature control module, with PID function
XD-E4PT3-P	4 channels PT100 (3-wire mode) temperature control module, with PID function
XD-E6TC-P	6 channels thermocouple temperature control module, with PID function
XD-E2TC-P	2 channels thermocouple temperature control module, with PID function
XD-E4SSI	4-channel SSI encoder position detection or displacement sensor position detection
XD-E2AD2PT2DA	2-channel analog output (16-bit), 2-channel PT100 temperature measurement, 2-channel analog output (10-bit); input and output voltage

	and current are optional
XD-E3AD4PT2DA	3-channel analog output (14-bit), 4-channel PT100 temperature measurement, 2-channel analog output (10-bit); input current and output voltage are optional

1-1-2. Module configuration

XD series expansion modules can be connected to the right side of PLC:

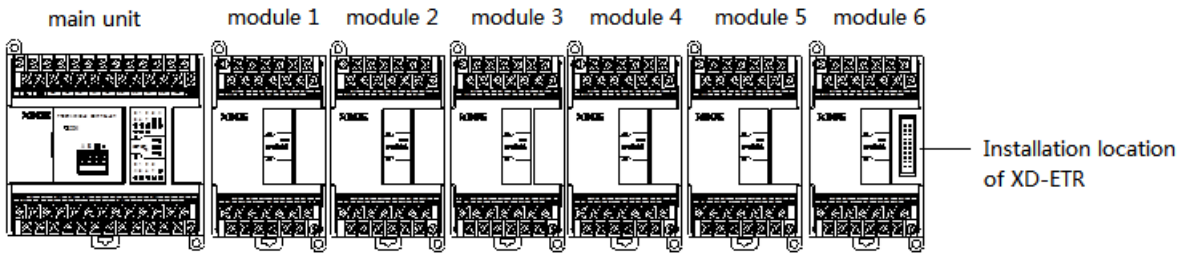
- Digital input, output terminal no. is octal number.
- Analog input, output terminal no. is decimal number.
- Up to 10 expansion modules can be connected to XD3 series PLC.
- Up to 16 expansion modules can be connect to XD5/XDM/XDC/XD5E/XDME series PLC.
- XD1 and XD2 series cannot support expansion module.



1-1-3. Terminal resistor XD-ETR

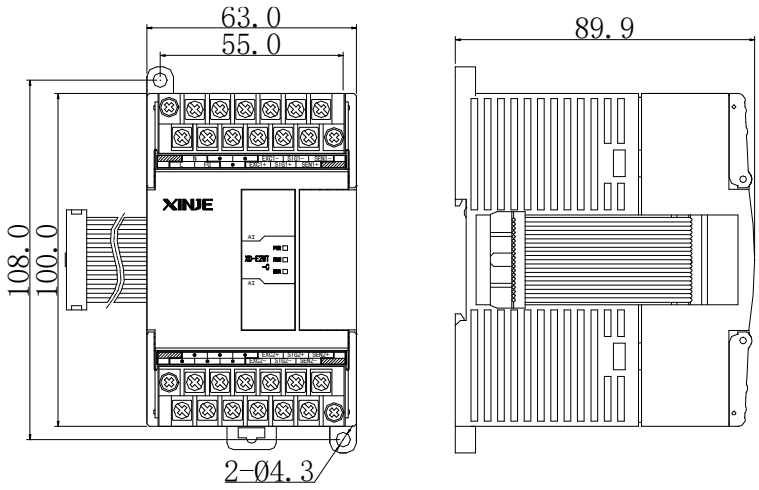
When the number of XD series PLC external right expansion modules is more than or equal to 5, terminal resistor module XD-ETR should be used together.

When using, please install XD-ETR on the expansion port of the rightmost module, as shown in the figure below:

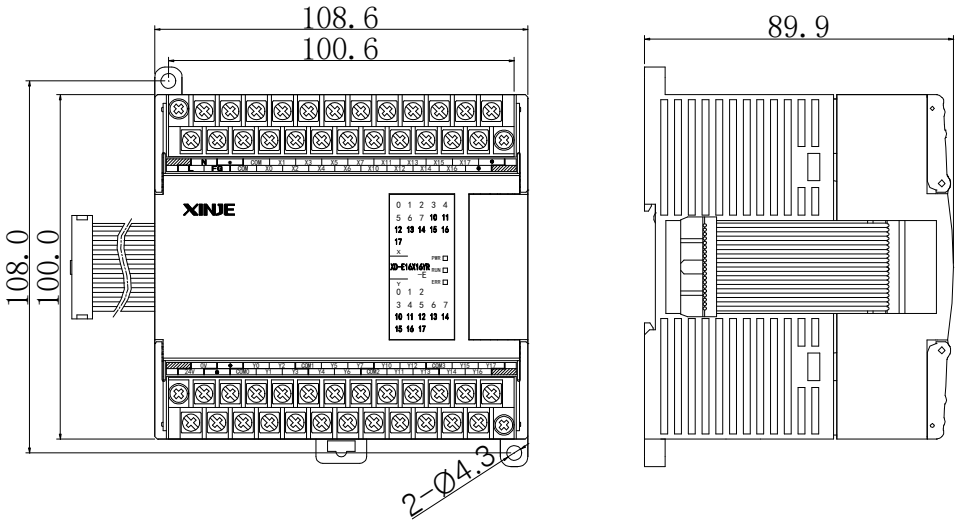


1-2. Dimensions

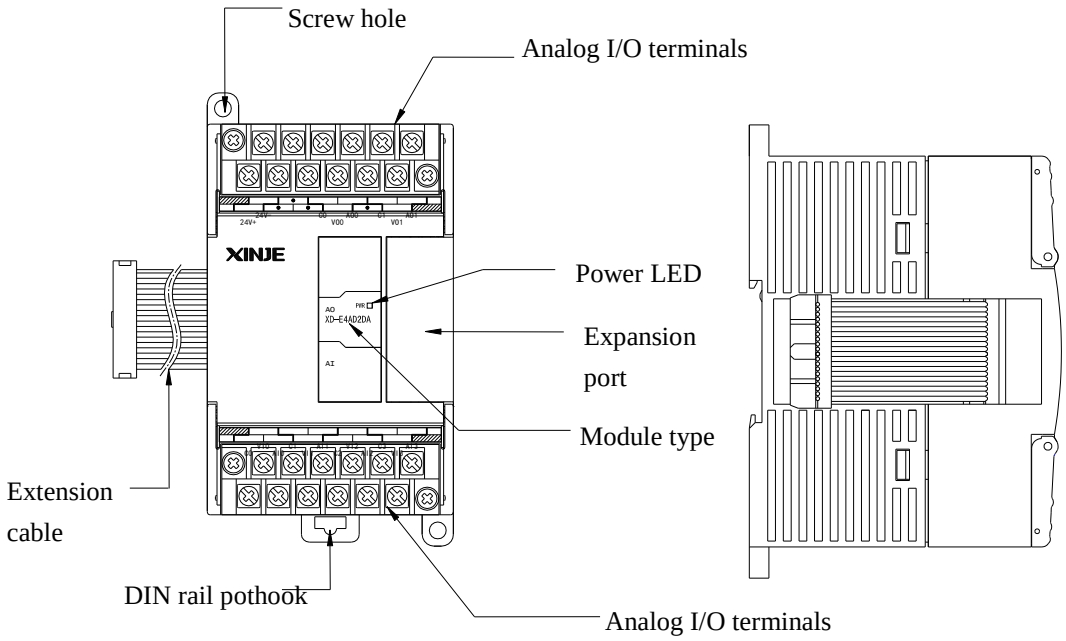
Analog, temperature, pressure modules, encoder detectioin, 8/16 points I/O modules: (dimension: mm)



32 points I/O modules, XD-E4WT-C, XD-E4WT-D module: (dimension: mm)



1-3. Module part name and function



Name		Function
Operation indicator	PWR	When the module has power supply, the indicator is on
	RUN	When the module communication port communicates normally, the indicator will be on
	ERR	When there is an error in the module, the indicator is always on or flashing (red). When the ERR light is always on, it means that the module has serious application error and can not be used, so the use mode must be adjusted, and the PLC body is switched to the stop state; when the err light is flashing, it means that the module has application error, abnormal work and abnormal data, but the PLC body is still run.
Module type		The type of expansion module
Expansion port		To connect the expansion module
Analog I/O terminals		To connect to analog input and output, the terminals are knock-down
DIN rail pothook		To mount the module, pull down the pothook to take away the module
Screw hole		Use M3 screw
Expansion cable		To connect the expansion module

Note: The operation indicator of some models or lower version of models is only PWR.

1-4. General specifications

Operating Environment	No corrosive gas
Ambient Temperature	0℃~60℃
Store Temperature	-20~70℃
Ambient Humidity	5~95% RH
Store Humidity	5~95% RH
Installation	Can be fixed with M3 screw or directly installed on DIN46277 rail (width: 35mm)

1-5. Module power and service conditions

XD series right expansion module can be used normally only when the internal and external power of PLC minus the internal and external power of module is greater than or equal to 0; if the PLC is equipped with BD board or ED module, the internal and external power consumed also needs to be subtracted; if the right expansion module and ED module use external power supply, the external power of PLC does not need to be subtracted.

Module power list

Module name	Internal power (extension cable)	External power (power supply terminal)
XD-E8X	0.6W	1.3W
XD-E8YR	2.2W	0
XD-E8YT	1.3W	0
XD-E8X8YR	2.2W	1.3W
XD-E8X8YT	1.5W	1.3W
XD-E16X	0.8W	2.5W
XD-E16YR	3.5W	0
XD-E16YT	2.3W	0
XD-E16X16YR-E/C	0	7W
XD-E16X16YT-E/C	0	5.5W
XD-E32YR-E/C	0	7W
XD-E32YT-E/C	0	4.5W
XD-E32X-E/C	0	7W
XD-E4AD2DA	0.7W	1.5W
XD-E4AD	0.7W	0.3W
XD-E8AD	0.7W	0.3W
XD-E8AD-A	0.7W	0.3W
XD-E8AD-V	0.7W	0.3W
XD-E2DA	0.7W	1.2W
XD-E4DA	0.7W	2W

XD-E6TC-P	0.7W	0.3W
XD-E6PT-P	0.7W	0.3W
XD-E2TC-P	0.7W	0.3W
XD-E2GRP	1.5W	6W
XD-E4SSI	1W	4W
XD-E1WT-A	0.7W	0.5W
XD-E2WT-A	0.7W	1W
XD-E4WT-A	0.7W	2W
XD-E2WT-B	0.7W	1W
XD-E2WT-C	0.7W	Only can use external power supply of AC 220 V, cannot use PLC internal power supply DC 24V
XD-E4WT-C	0.7W	
XD-E1WT-D	0.7W	0.5W
XD-E2WT-D	0.7W	1W
XD-E4WT-D	0.7W	2W

PLC power list

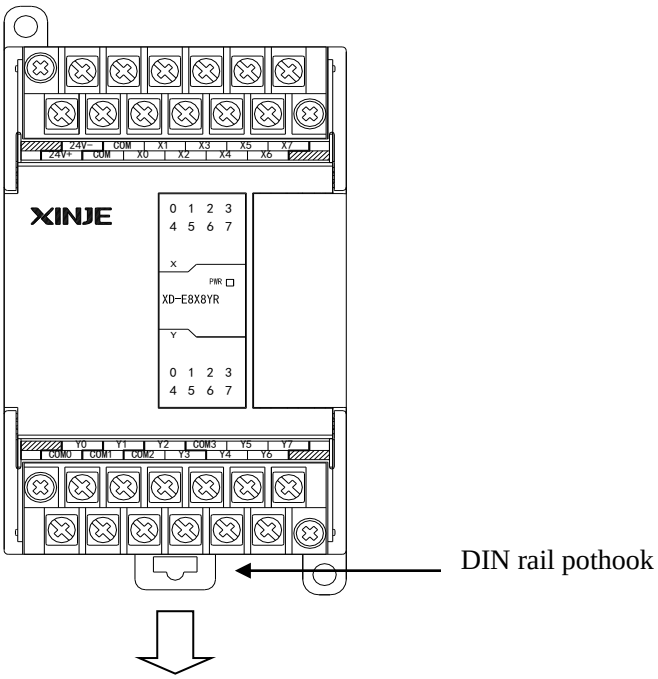
PLC model	Internal power	External power
16 points PLC	5~6W	6W
24 points PLC	10.5~12.5W	12.5W
32 points PLC	10~12W	12W
48 points PLC	9.5~11.5W	9.5W
60 points PLC	9~11W	8W

Others

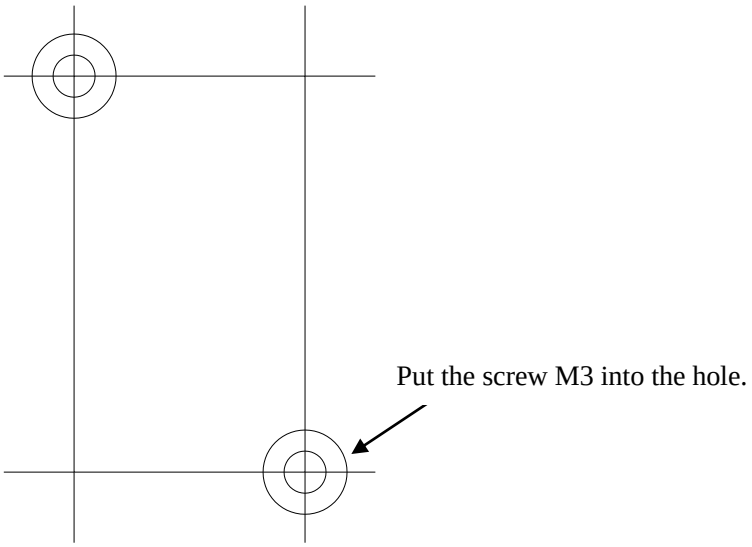
Model	Internal power	External power
XD-2AD2PT-V-ED and other analog ED	Very small, can be neglected	0.5~2.5W
XD-NES-ED	1W	-
BOX-ED	Very small, can be neglected	0.5~2.5W
XD-NE-BD	1W	-

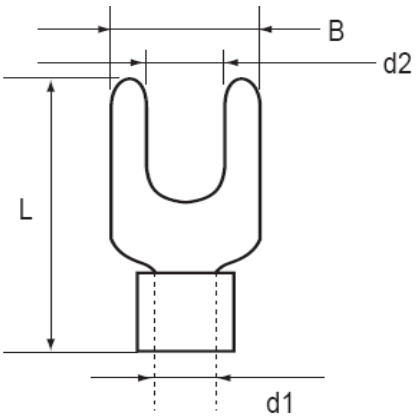
1.6 Module installation

XD series expansion module can be connected to the right side of PLC. Fix the module on the DIN46277 rail or with screw M3.
DIN46277 rail:



The module can be mounted on the DIN46277 rail (width 35mm). Pull down the DIN rail pothook to uninstall the module.
Direct installation: put the screw (M3) to fix the module.





Terminal wiring:

■ Y terminal

Y terminal dimension

B: Y outer dimension

d1: Outer diameter connecting to the wire

d2: Internal diameter (press the screw)

L: Whole length

Suitable dimension:

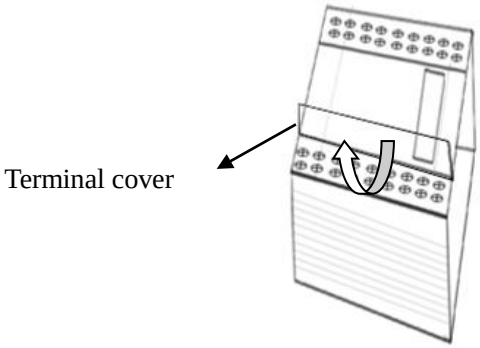
B: below 6mm L: below 13mm

d2: below 3.2mm

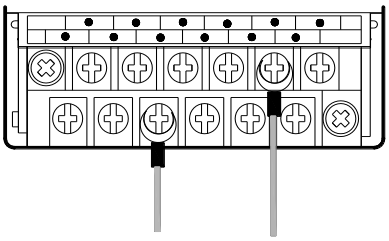
■ Wiring method

A. Cut off the power supply

B. Open the front cover



C. Put the terminal of signal wire on the I/O terminal tightens the screw.



D. Close the I/O terminal cover

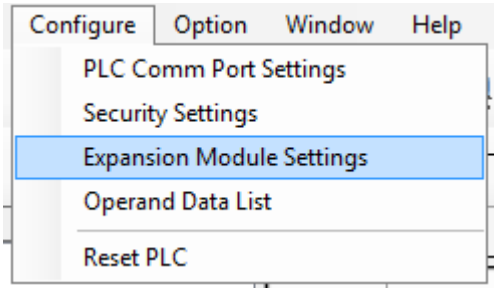
Notes:

1. Confirm the specification of the module
2. The scraps cannot fall into the module when wiring
3. Before wiring, confirm the specifications of module and device again
4. Make sure the wire connection is firm, otherwise data incorrectness and circuit shorting will happen
5. Cut the power before Installation and wiring

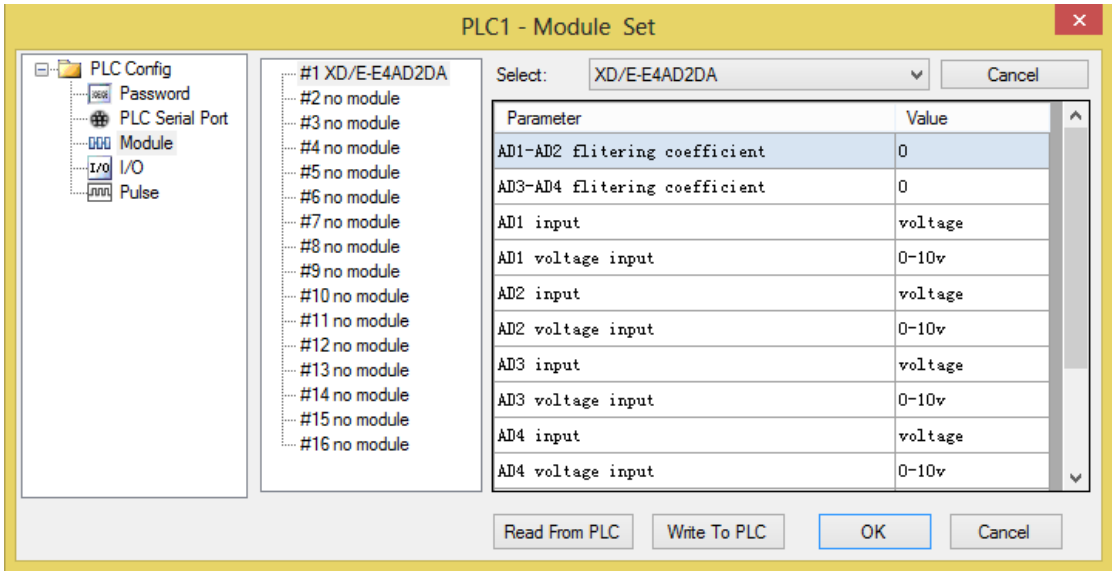
1-7. Configure the module

Before using the expansion module, please configure the module in XDPpro software.
Next we will introduce the configuration steps. Take XD-E4AD2DA as an example.

A. Open the XDPpro software, click Configure/expansion module settings.



B. Choose the module type and channel parameters in the following window. Then click write to PLC.

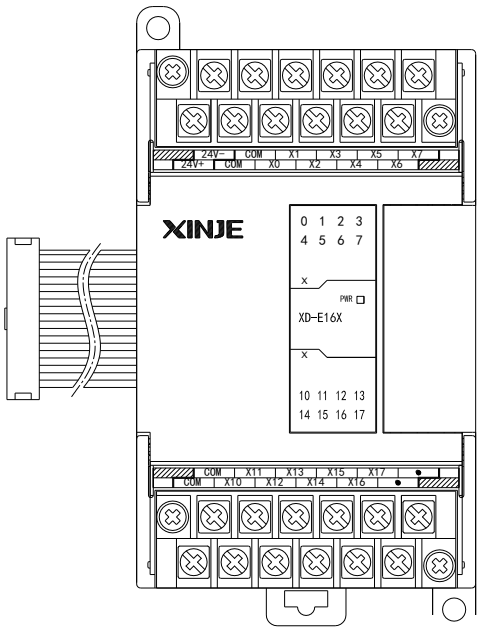


C. Cut the PLC power supply and give the power again to make the setting effective.

2. I/O expansion module XD-EnXmY

2-1. Specifications

XD-EnXmY is the extension module of XD series, up to 10 XD-EnXmY modules can be connected to XD3 series PLC (up to 16 modules for XD5/XDM/XDC/XD5E/XDME series PLC). This module has rich types, small size, and more I/O points which can meet more requirements.



Module types

Model		Function
NPN input	**PNP input**	
XD-E8X	XD-E8PX	8 channels digital input
XD-E8YR	-	8 channels relay output
XD-E8YT	-	8 channels transistor output
XD-E8X8YR	XD-E8PX8YR	8 channels digital input, 8 channels relay output
XD-E8X8YT	XD-E8PX8YT	8 channels digital input, 8 channels transistor output
XD-E16X	XD-E16PX	16 channels digital input
XD-E16YR	-	16 channels relay output
XD-E16YT	-	16 channels transistor output
XD-E16X16YR-E	XD-E16PX16YR-E	16 channels digital input, 16 channels relay output, AC220V
XD-E16X16YR-C	XD-E16PX16YR-C	16 channels digital input, 16 channels relay output, DC24V
XD-E16X16YT-E	XD-E16PX16YT-E	16 channels digital input, 16 channels transistor output, AC220V
XD-E16X16YT-C	XD-E16PX16YT-C	16 channels digital input, 16 channels transistor output, DC24V
XD-E32YR-E	-	32 channels relay output, AC220V
XD-E32YR-C	-	32 channels relay output, DC24V
XD-E32YT-E	-	32 channels transistor output, AC220V

XD-E32YT-C	-	32 channels transistor output, DC24V
XD-E32X-E	XD-E32PX-E	32 channels digital input, AC220V
XD-E32X-C	XD-E32PX-C	32 channels digital input, DC24V

Module Specifications

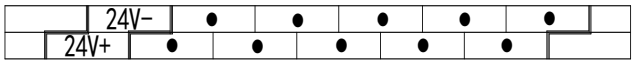
Items	Specifications
Input voltage (Power supply)	DC24V±10%　(32 points module is AC220V±10%)
Application environment	No corrosive gas
Environment temperature	0℃~60℃
Environment humidity	5~95%
Installation	Fixed with M3 screws or directly installed on DIN46277 rail (Width: 35mm)
Dimension	8~16 points module: 63mm×108mm×89.9mm 32 points module: 108.6mm×108mm×89.9mm

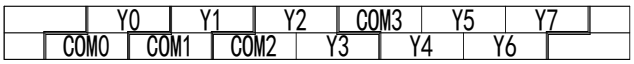
2-2. Terminals

The terminals distributions of NPN and PNP input are the same.

(1) XD-E8X

(2) XD-E8YR, XD-E8YT

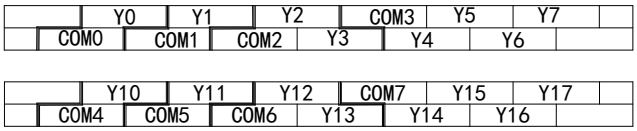




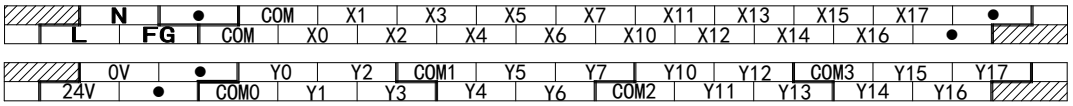
(3) XD-E8X8YR, XD-E8X8YT

(4) XD-E16X

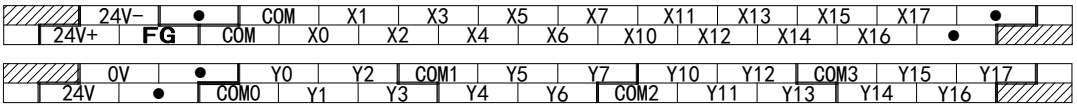
(5) XD-E16YR, XD-E16YT



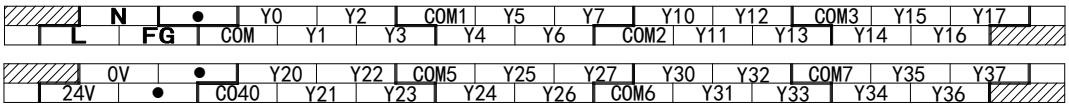
(6) XD-E16X16YR/T-E



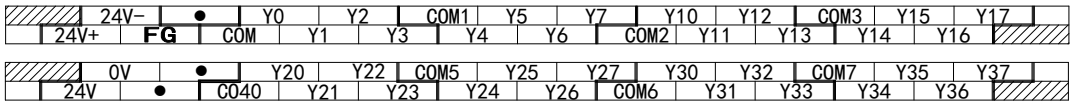
(7) XD-E16X16YR/T-C



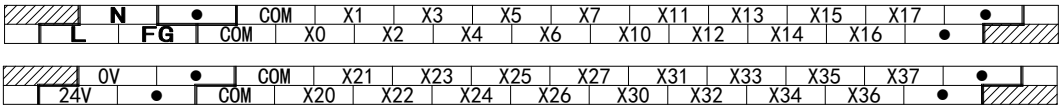
(8) XD-E32YR/T-E



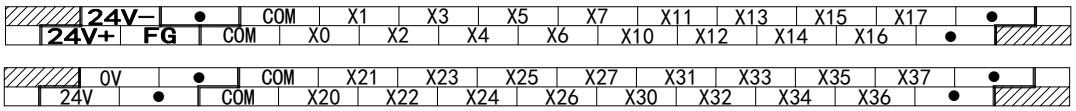
(9) XD-E32YR/T-C



(10)XD-E32X-E



(11)XD-E32X-C



Caution: Maybe the common terminal of each module is different from above pictures; please see the label of actual objects.

2-3. I/O address assignment

XD3 series can expand 10 modules, XD5/XDM/XDC/XD5E/XDME series PLC can expand 16 modules. The address of I/O terminals are shown as below:
(Caution: Take NPN type as an example, the terminals definition, address, suitable module of PNP are the same as NPN)

2-5. Module parameters

There are two parameters for the module: positive or negative logic, filter time.

There are two setting methods:

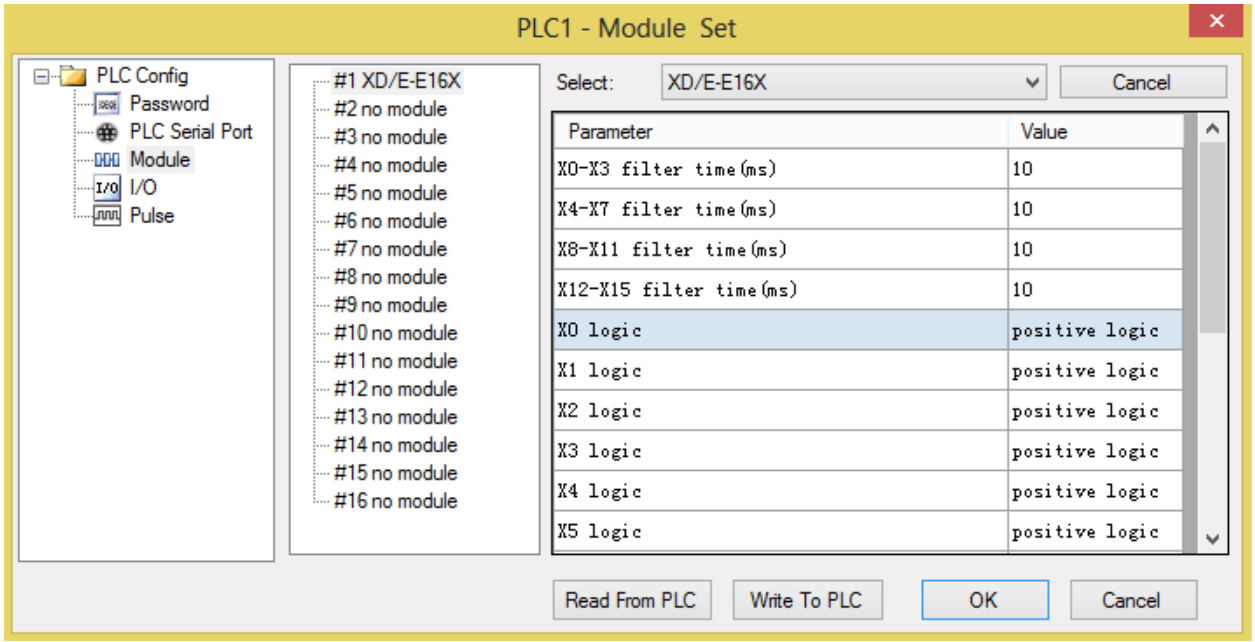
(1) XDPpro software

Open the XDPpro software, click configure/expansion module settings:

Set the model and channel parameters in the following window. Then click write to PLC.

Please restart the PLC after setting.

Note: please select XD/E-8X8Y for configuring XD-E8X, XD-E8YR, XD-E8YT.



(2) Set through SFD register

Module no.	SFD address	Module no.	SFD address
#1	SFD350~SFD359	#9	SFD430~SFD439
#2	SFD360~SFD369	#10	SFD440~SFD449

Byte13	X24 logic	-	X25 logic	-	X26 logic	-	X27 logic	-	
Byte14	X30 logic	-	X31 logic	-	X32 logic	-	X33 logic	-	
Byte15	X34 logic	-	X35 logic	-	X36 logic	-	X37 logic	-	
Byte 16~19	-	-	-	-	-	-	-	-	

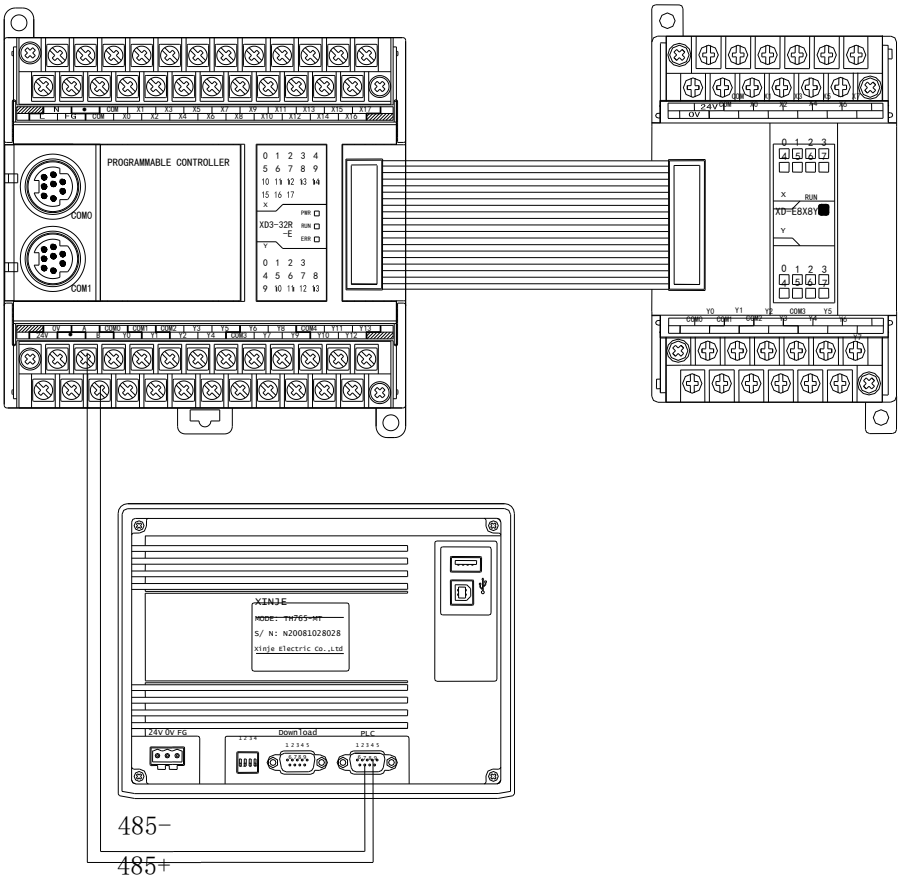
Note:

1. User can set the discrete input filter time, the time can be 1, 2, 3, 4, 5, 10, 15, 20, 25, 30, 35, 40, 45, 50. The default filter time is 10ms.
2. User can set the discrete input and output polarity: 0 is positive logic; 1 is negative logic.
3. Positive logic: the input point is on when there is a signal, and off when there is no signal; Negative logic: the input point is on when there is no signal, and off when there is signal.

2-6. Applications

The application example includes three devices: Xinje XD3 series PLC (slave station), expansion module XD-E8X8YR and HMI TH765-NT.

The communication between XD-E8X8YR and TH765-NT:



In this example, the HMI is the master station, read the input status of extension module to the HMI, writes the coil status of HMI to the extension module.

(1) Hardware connection: Connect XD-E8X8YR with XD3-32R-E, connect AB terminals of XD3-32R-E to AB terminals (PLC port) of TH765-NT.

Communication parameters setting of PLC:

Baud rate: 19200bps, Data bits: 8bits, Stop bits: 1bit, Parity: even, Modbus number: 1, restart the PLC after setting.

Touchwin software settings for TH765-NT:

PLC port device: “Modbus RTU (Panel is master)”, Baud rate: 19200bps, Data bits: 8bits, Stop bits: 1bit, Parity: even.

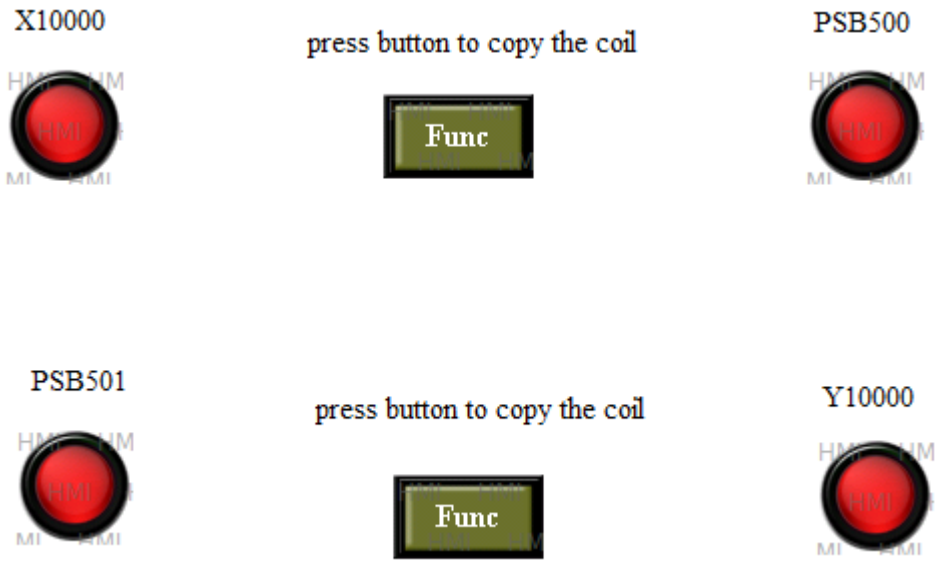
(2) Program application:

The corresponding relationship between expansion module address and HMI address:

HMI address		Expansion module	Related MODBUS address
PSB500	⟷	X10000	K20736
PSB501	⟷	Y10000	K24832

(3) HMI screen editing:

The screen of HMI:



Edit the status of X10000:

Lamp X10000: the Modbus address of expansion module coil X10000 is 0x20736 (diagram A).

Function Button: copy the coil status of X10000 to PSB500 when the button is pressed (diagram B).

Lamp PSB500: HMI internal coil address is PSB500. (diagram C)

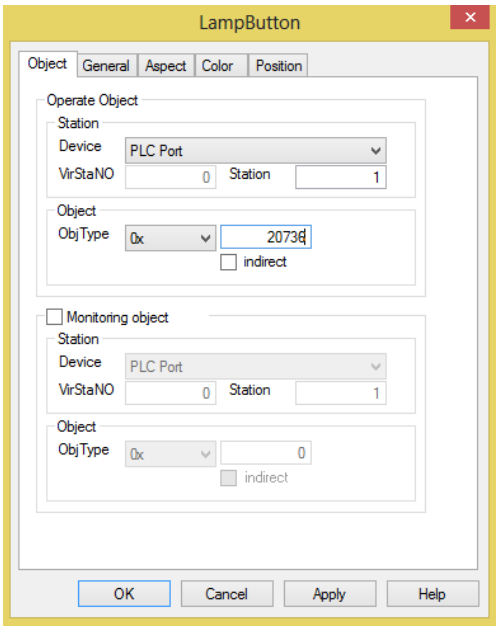


Diagram A

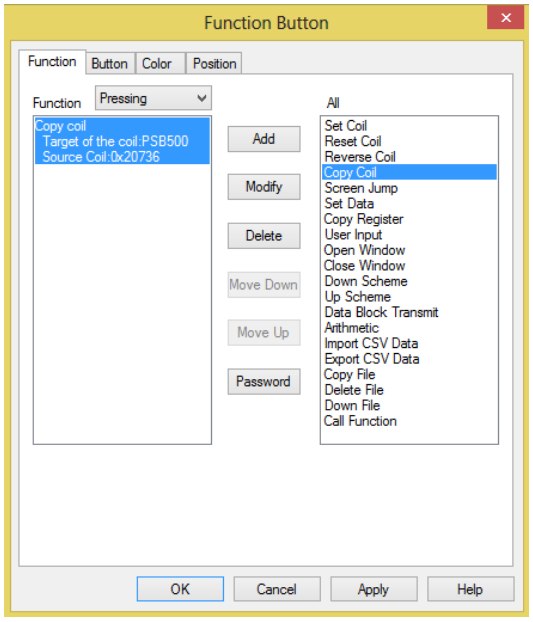

Diagram B

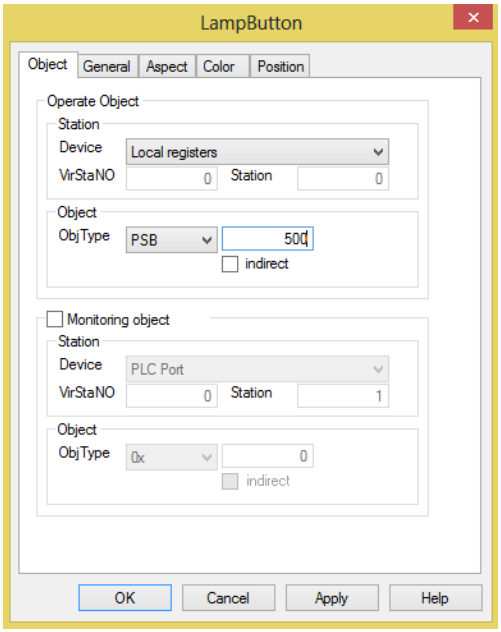

Diagram C

Edit the status of PSB501:

Lamp PSB501: the HMI internal coil address is PSB501 (diagram D);

Function Button: copy the coil status of PSB501 to Y10000 when the button is pressed (diagram E);

Lamp Y10000: the Modbus address of expansion module coil Y10000 is 0x24832 (diagram F).

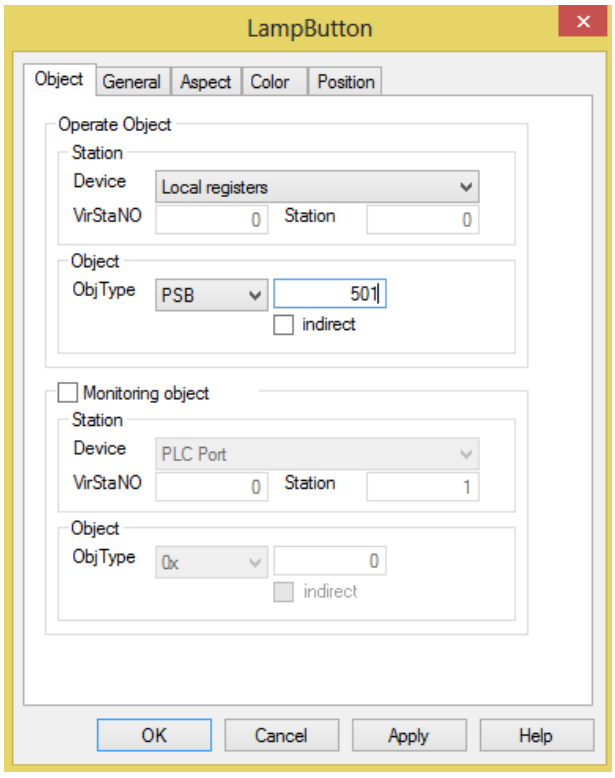

Diagram D

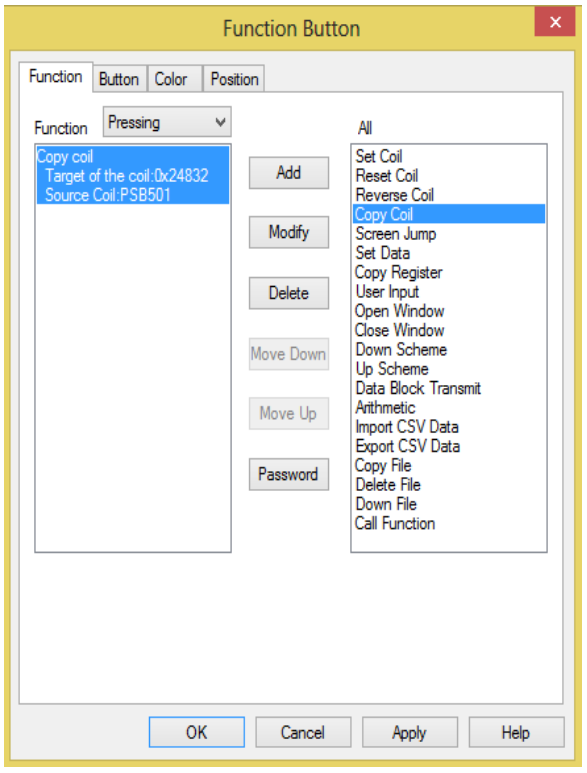

Diagram E

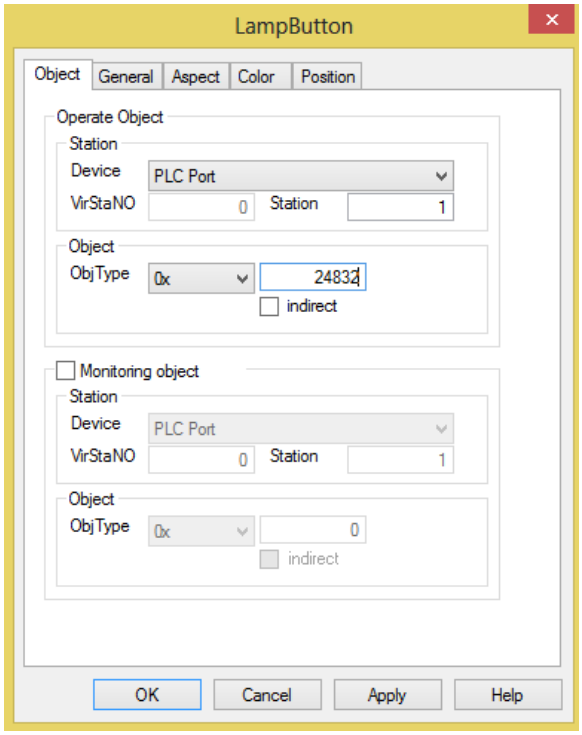

Diagram F

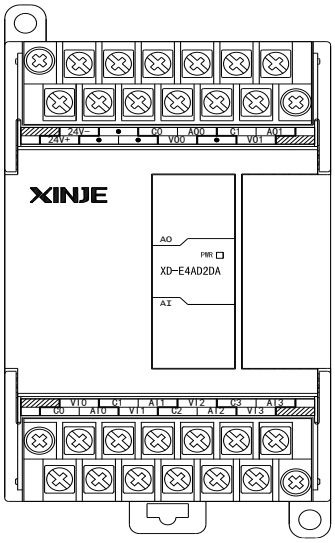
After editing the HMI screen, download it to the HMI and start to work.

3. Analog input/output module XD-E4AD2DA

3-1. Specification

XD-E4AD2DA transform the 4 channels analog value to digital value, 2 channels digital value to analog value, and send them to PLC.



Features:

- 4-channel analog input: voltage input and current input can be selected
- 2 channel analog output
- 14-bit high precision analog input
- As a special function module of XD series, XD3 can connect up to 10 modules on the right side of PLC main unit, XD5/XDM/XDC/XD5E/XDME can expand 16 modules, XD1/XD2 does not support expansion modules.

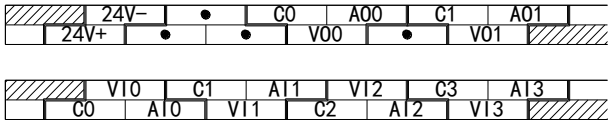
Module sepcifications:

Items	Analog input (AD)		Analog output (DA)	
	Voltage input	Current input	Voltage output	Current output
Analog input bound	0~5V, 0~10V, -5~5V, -10~10V (impedance>1M)	0~20mA, 4~20mA, -20~20mA (impedance is about 120 Ω)	-	
Max input bound	DC ±15V	-40~40mA	-	
Analog output bound	-		0~5V, 0~10V, -5~5V, -10~10V (Exterior load resistance 2KΩ~1MΩ)	0~20mA, 4~20mA (Exterior load resistance is less than 500Ω)
Digital input bound	-		12 bits binary data (0~4095 or -2048~2047)	

Digital output bound	14 bits binary data (0~16383 or -8192~8191)	-
Distinguish ratio	1/16383(14Bit)	1/4095(12Bit)
Integrate precision	±1%	
Convert speed	2ms per channel	2ms per channel
Power used by analog	DC24V ±10%,150mA	
Install format	Fixed with M3 screws or directly installed on orbit of DIN46277 (Width: 35mm)	
Exterior size	63mm×108mm×89.9mm	

Note: XD-E4AD2DA module of V6 and below version cannot support the range of -5~5V, -10~10V, -20~20mA.

3-2. Terminals



Channel	Terminal name	Signal name
CH0	AI0	Current input
	VI0	Voltage input
	C0	CH0 common terminal of analog input
CH1	AI1	Current input
	VI1	Voltage input
	C1	CH1 common terminal of analog input
CH2	AI2	Current input
	VI2	Voltage input
	C2	CH2 common terminal of analog input
CH3	AI3	Current input
	VI3	Voltage input
	C3	CH3 common terminal of analog input
CH0	AO0	Current output
	VO0	Voltage output
	C0	CH0 common terminal of analog output
CH1	AO1	Current output
	VO1	Voltage output
	C1	CH1 common terminal of analog output
-	24V+	+24V power supply
	24V-	Common terminal of power supply

3-3. The assignment of I/O address

XD series analog modules do not occupy I/O units; the converted data is directly transferred into PLC register,

Register address of module1:

Channel	AD signal	Channel enable bit (set ON the bit to use this channel)	Channel alarm flag bit
0CH	ID10000	Y10000	X10000

Channel	AD signal	Channel enable bit (set ON the bit to use this channel)	Channel alarm flag bit
0CH	ID11500	Y11700	X11700
1CH	ID11501	Y11701	X11701
2CH	ID11502	Y11702	X11702
3CH	ID11503	Y11703	X11703
Channel	DA signal		
0CH	QD11500	Y11704	
1CH	QD11501	Y11705	

Note:

1. Disable the unused channel to improve the I/O scanning speed.
2. If set off the enable bit of the input channel, this channel will not accept the data. (the data display is 0).
3. If set off the enable bit of the output channel, this channel will keep the former data.

3-4. Working mode

There are two ways to set the working mode:

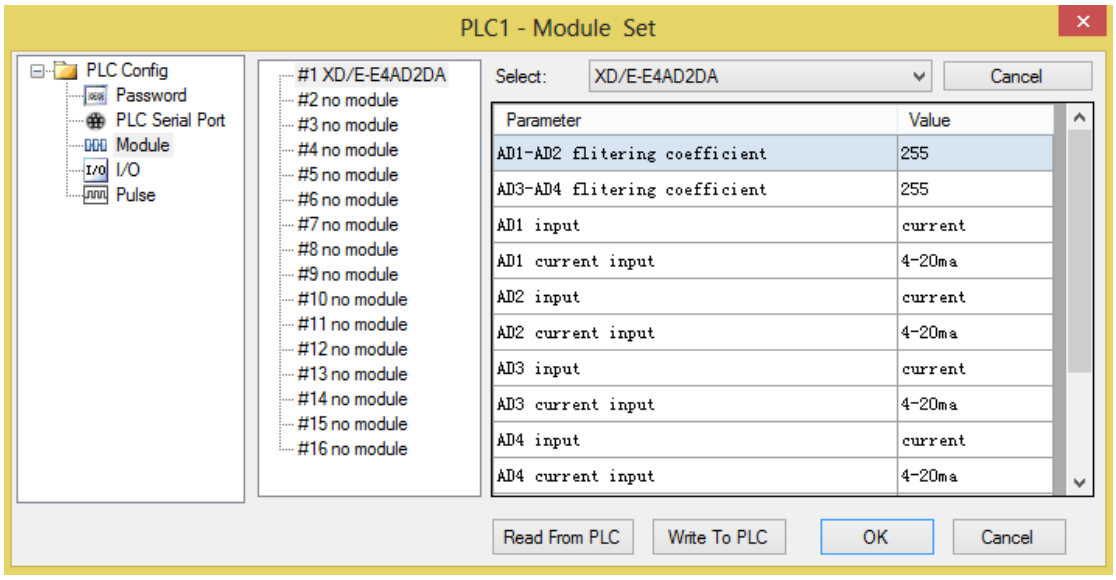
1. XDPpro software
2. Flash registers of PLC

XDPpro software:

Open the XDPpro software, click configure/expansion module settings.

Set the model and channel parameters in the following window. Then click write to PLC.

Please restart the PLC after setting.



Note:

1. The first-order low-pass filtering method uses this sampling value and the last filtering output value for weighting to get the effective filtering value.

2. The filter coefficient is set to 0 ~ 254 by the user, the smaller the value is, the more stable the data is, but it may cause data lag; when it is set to 1, the filtering effect is the strongest, and when it is set to 254, the filtering effect is the weakest, and the default value is 0 (no filtering).

3. When the module flag bit 
is set on, please monitor X but not Y, as Y is channel enable bit.

For example: When the first channel of AD is set to voltage mode and AD detects short circuit / open circuit / over range, X10000 will be set to on;

The first channel of AD is set to current mode. When AD is detected as over range, X10000 will be set to on.

Flash registers:

The module has current and voltage mode. Current has choices of 0~20mA, 4~20mA; voltage has choices of 0~5V, 0~10V. These parameters can be set through SFD registers.

Module no.	SFD address	Module no.	SFD address
#1	SFD350~SFD359	#9	SFD430~SFD439
#2	SFD360~SFD369	#10	SFD440~SFD449
#3	SFD370~SFD379	#11	SFD450~SFD459
#4	SFD380~SFD389	#12	SFD460~SFD469

#5	SFD390~SFD399	#13	SFD470~SFD479
#6	SFD400~SFD409	#14	SFD480~SFD489
#7	SFD410~SFD419	#15	SFD490~SFD499
#8	SFD420~SFD429	#16	SFD500~SFD509

Note: As shown in the preceding table, every register set 4 channels mode, each register has 16 bits, from low to high, every 4 bits set 1 channel mode.

SFD register bit definition:

Module no.1:

<table>
<tr><th colspan="2">Register</th><th>Bit7</th><th>Bit6</th><th>Bit5</th><th>Bit4</th><th>Bit3</th><th>Bit2</th><th>Bit1</th><th>Bit0</th><th>Notes</th></tr>
<tr><td rowspan="2">SFD350</td><td>Byte0</td><td colspan="8">AD channel 1, 2 filtering coefficient</td><td rowspan="2">AD filtering coefficient</td></tr>
<tr><td>Byte1</td><td colspan="8">AD channel 3, 4 filtering coefficient</td></tr>
<tr><td rowspan="6">SFD351</td><td rowspan="3">Byte2</td><td>Bit7</td><td>Bit6</td><td>Bit5</td><td>Bit4</td><td>Bit3</td><td>Bit2</td><td>Bit1</td><td>Bit0</td><td rowspan="6">To set the input range of AD/DA module.
Byte2 low 4-bit is to set AD Channel 1, high 4-bit is to set AD channel 2.
Byte3 Low 4-bit is to set AD channel 3, high 4-bit is to set AD channel 4. Byte4</td></tr>
<tr><td colspan="4">AD2</td><td colspan="4">AD1</td></tr>
<tr><td>-</td><td colspan="3">000：0~10V

101：-5~5V
010：0~20mA
011：4~20mA
110：-20~20mA</td><td>-</td><td colspan="3">000：0~10V
001：0~5V
100：-10~10V
101：-5~5V
010：0~20mA
011：4~20mA
110：-20~20mA</td></tr>
<tr><td rowspan="2">SFD352</td><td rowspan="2">Byte4</td><td>Bit7</td><td>Bit6</td><td>Bit5</td><td>Bit4</td><td>Bit3</td><td>Bit2</td><td>Bit1</td><td>Bit0</td></tr>
<tr><td colspan="4">DA2</td><td colspan="4">DA1</td></tr>
</table>

		-	000：0~10V 001：0~5V 100：-10~10V 101：-5~5V 010：0~20mA 011：4~20mA 110：-20~20mA	-	000：0~10V 001：0~5V 100：-10~10V 101：-5~5V 010：0~20mA 011：4~20mA 110：-20~20mA	low 4-bit is to set DA channel 1, high 4-bit is to set DA Channel 2.
	Byte5	AD channel short circuit / open circuit / over range detection bit				
SFD353~SFD359		-				

For example:

Set the module no.1 AD channel 3, 2, 1, 0 working mode to 0～20mA, 4～20mA, 0～10V, 0～5V. Set the channel 1 and 2 filter factor to 254, set the channel 3 and 4 filter factor to 100. Set DA channel 1 and 0 working mode to 0～10V, 0～20mA.

So the SFD register values are:

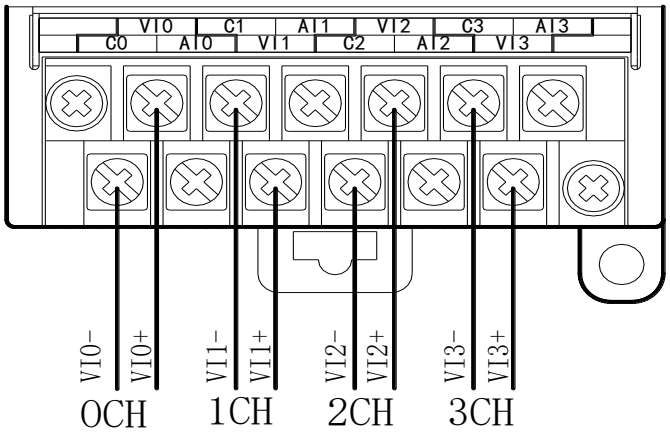
SFD350=64FEH　　SFD351=4C1H　　SFD352=10H

3-5. Exterior connection

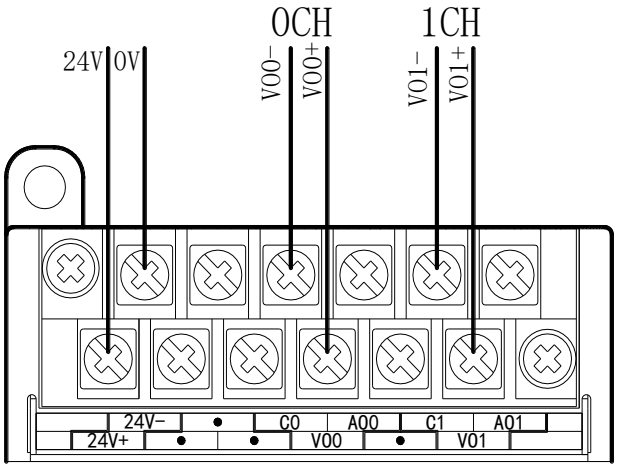
When make exterior connection, please read the following items:

- When connect＋24V power, please choose 24V power of PLC to avoid interference.
- To avoid interference, please use shield cable and single point ground for the shield layer.

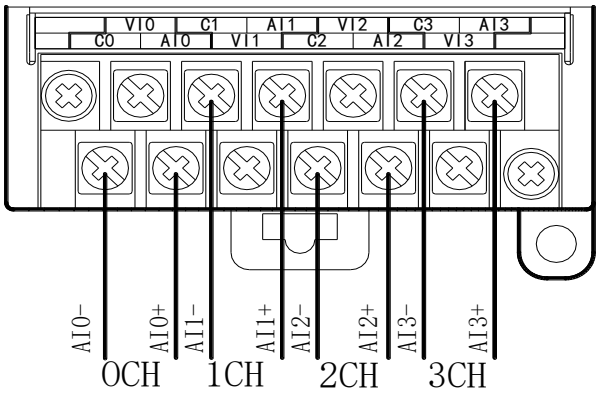
Voltage input



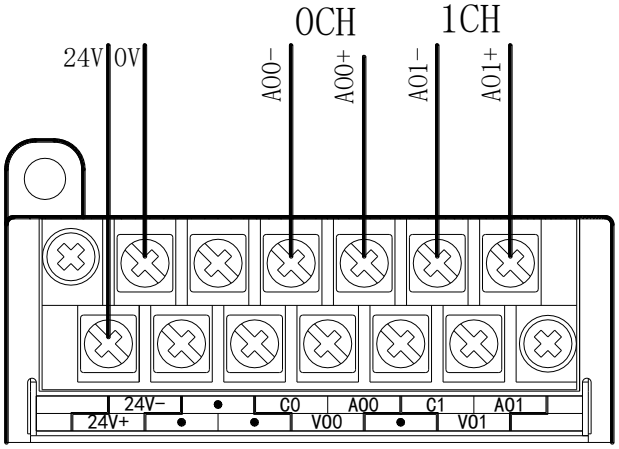
Voltage output



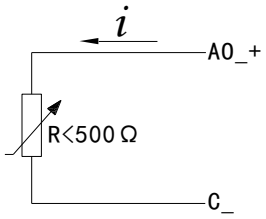
Current input



Current output

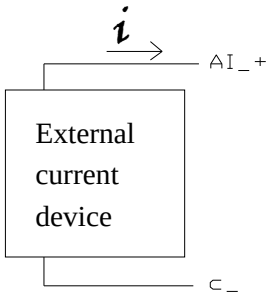


XD-E4AD2DA current output wiring:



Note: There is no need to connect DC24 power supply in series for current output.

XD-E4AD2DA current input wiring:

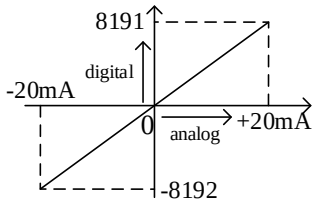


3-6. AD conversion diagram

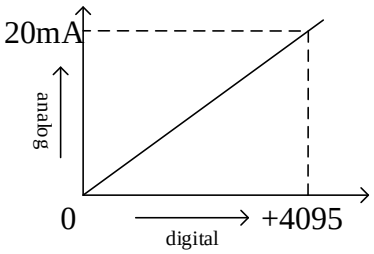
The relationship between analog input and corresponding digital value:

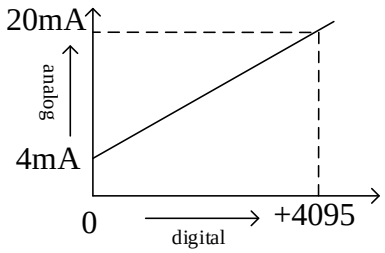
0~5V analog input	0~10V analog input
	-5~5V analog input	-10~10V analog input
	0~20mA analog input	4~20mA analog input
	-20~20mA analog input	



The relationship between digital output value and corresponding analog value:

0~5V analog output	0~10V analog output
	-5~5V analog output	**-10~10V analog output**
	0~20mA analog output	**4~20mA analog output**
	




Note:

1. When input data exceeds 4095, analog output will keep the max value of 5V, 10V or 20mA.
2. When the AD voltage input is suspended, the corresponding register will show 16383; when the AD current input is suspended, the corresponding register will show 0.

3-7. Programming

Example:

The output signal of the existing pressure sensor needs to be collected (pressure sensor performance parameters: detection pressure range of 0MP ~ 10MP, output analog signal of 4 ~ 20mA), and a 0V ~ 10V voltage signal needs to be output to the inverter.

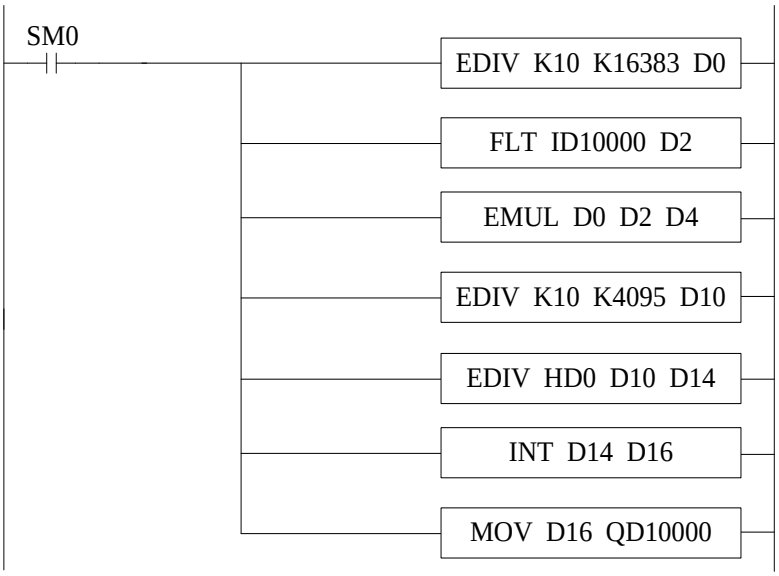
Analysis:

Since the pressure detection range of the pressure sensor is 0MP ~ 10MP, the corresponding output analog quantity is 4~20mA, and the digital quantity range converted by the expansion module through analog-to-digital conversion is 0~16383; therefore, we can skip the analog quantity 4~20mA in the intermediate conversion link, then the pressure detection range is 0MP ~ 10MP, the corresponding digital quantity range is 0 ~ 16383; 10MP / 16383 = 0.000610388. So as long as the real-time value collected in the ID register of the expansion module is multiplied by 0.000610388, the real-time pressure of the current pressure sensor can be calculated; for example, if the number collected in the ID register is 4095, the corresponding pressure is 2.5MP.

Similarly, the range of digital value set in the register QD of the expansion module is 0 ~ 4095, which corresponds to the voltage output signal 0V ~ 10V, and 10V / 4095 = 0.002442 indicates how much voltage value is output for each digital value set in the register QD of the expansion module; for example, 3V voltage value needs to be output now, 3V / 0.002442 = 1228.5, and the calculated digital value is sent to the corresponding QD register.

Note: please use floating-point operation for calculation, otherwise the calculation accuracy will be affected or even unable to calculate!

The program:



Explanation:

SM0 is normally on coil, which is always on during PLC operation.

When PLC starts to run, analog quantity acquisition first calculates the pressure value corresponding to each digit 1 of the digital quantity collected by the expansion module, and then converts the digital quantity (integer) collected in ID10000 register into floating-point number. The real-time value collected in ID10000 register of

the expansion module multiplied by the pressure value corresponding to each digit 1 of the digital quantity collected by the expansion module is the real-time pressure value.

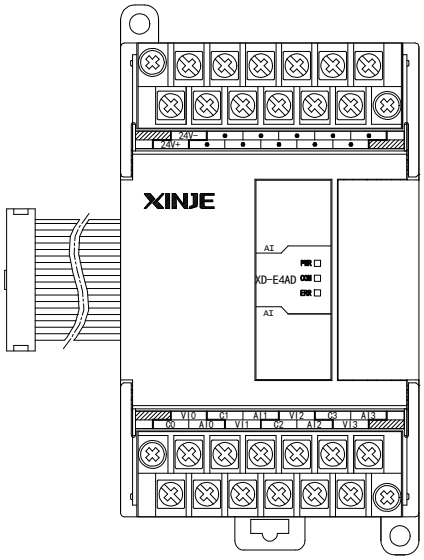
Similarly, the analog output first calculates the voltage value corresponding to each digit 1 of the digital quantity collected by the expansion module, divides the set target voltage value by the digital quantity corresponding to each digit 1 can get the digital quantity (floating-point number) to be set. Since QD10000 register can only store integers, it is necessary to convert the floating-point number to integer and send to QD10000.

Note: please turn on the enable bit of the used channel, that is, set Y10000 and Y10004 to on.

4. Analog Input Module XD-E4AD

4-1. Specifications

XD-E4AD transform the analog input (current or voltage) to digital value and send to PLC register.



Features:

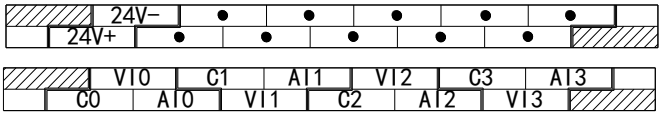
- 4-channel analog input: two modes of voltage input and current input can be selected.
- 14-bit high precision analog input.
- As a special function module of XD series, XD3 can connect up to 10 modules on the right side of PLC main unit, XD5/XDM/XDC/ XD5E/XDME can expand 16 modules, XD1 / XD2 does not support expansion modules.

Specifications:

ITEMS	Analog Input (AD)	
	Voltage Input	Current Input
Analog Input Range	0~5V, 0~10V, -5~5V, -10~10V (impedance > 1M)	0~20mA, 4~20mA, -20~20mA (impedance is about 120Ω)
Maximum Input Range	DC ±15V	-40~40mA
Digital Output Range	14 bits binary (0~16383 or -8192~8191)	
Resolution	1/16383(14Bit)	
Synthesis Precision	±1%	
Conversion Speed	2ms per channel	
Power Supply	DC24V ±10%,150mA	
Installation	Fix with M3 screw or install on DIN46277 guilder (Width: 35mm) directly	
Dimension	63mm×108mm×89.9mm	

Note: XD-E4AD module below version V7 does not support- 5 ~ 5V, -10 ~ 10V, -20 ~ 20mA range.

4-2. Terminals



Channel	Terminal name	Signal name
CH0	AI0	Current input
	VI0	Voltage input
	C0	CH0 common terminal
CH1	AI1	Current input
	VI1	Voltage input
	C1	CH1 common terminal
CH2	AI2	Current input
	VI2	Voltage input
	C2	CH2 common terminal
CH3	AI3	Current input
	VI3	Voltage input
	C3	CH3 common terminal
-	24V+	+24V power supply
	24V-	Common terminal of power supply

4-3. I/O address assignment

XD series expansions do not occupy I/O units; the converted value is sent to PLC register directly.
Note: each channel can work after turning on the channel enable bit.

Expansion module 1 address

Channel	AD signal	Channel enable bit (set ON the enable bit to use this channel)	Channel alarm bit
0CH	ID10000	Y10000	X10000
1CH	ID10001	Y10001	X10001
2CH	ID10002	Y10002	X10002
3CH	ID10003	Y10003	X10003

Expansion module 2 address

Channel	AD signal	Channel enable bit (set ON the enable bit to use this channel)	Channel alarm bit
0CH	ID10100	Y10100	X10100

3CH	ID11003	Y11203	X11203

Expansion module 12 address

Channel	AD signal	Channel enable bit (set ON the enable bit to use this channel)	Channel alarm bit
0CH	ID11100	Y11300	X11300
1CH	ID11101	Y11301	X11301
2CH	ID11102	Y11302	X11302
3CH	ID11103	Y11303	X11303

Expansion module 13 address

Channel	AD signal	Channel enable bit (set ON the enable bit to use this channel)	Channel alarm bit
0CH	ID11200	Y11400	X11400
1CH	ID11201	Y11401	X11401
2CH	ID11202	Y11402	X11402
3CH	ID11203	Y11403	X11403

Expansion module 14 address

Channel	AD signal	Channel enable bit (set ON the enable bit to use this channel)	Channel alarm bit
0CH	ID11300	Y11500	X11500
1CH	ID11301	Y11501	X11501
2CH	ID11302	Y11502	X11502
3CH	ID11303	Y11503	X11503

Expansion module 15 address

Channel	AD signal	Channel enable bit (set ON the enable bit to use this channel)	Channel alarm bit
0CH	ID11400	Y11600	X11600
1CH	ID11401	Y11601	X11601
2CH	ID11402	Y11602	X11602
3CH	ID11403	Y11603	X11603

Expansion module 16 address

Channel	AD signal	Channel enable bit (set ON the enable bit to use this channel)	Channel alarm bit
0CH	ID11500	Y11700	X11700
1CH	ID11501	Y11701	X11701
2CH	ID11502	Y11702	X11702
3CH	ID11503	Y11703	X11703

Note:

1. Forbid the unused channel to improve the I/O scanning speed.
2. If set off the enable bit of the input channel, this channel will not accept the data. (the data display is 0).

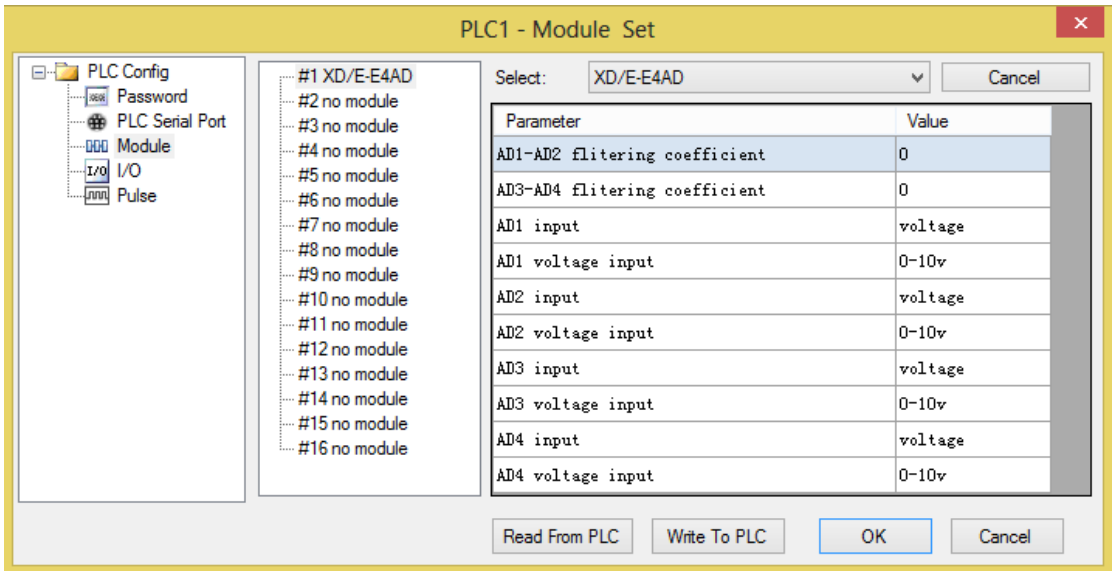
4-4. Working mode

There are two ways to set the working mode:

1. XDPpro software
2. Flash registers of PLC

XDPpro software:

Open the XDPpro software, click configure/expansion module settings:
Set the model and channel parameters in the following window. Then click write to PLC.
Please restart the PLC after setting.



Note:

1. The first-order low-pass filtering method uses this sampling value and the last filtering output value for weighting to get the effective filtering value.

2. The filter coefficient is set to 0 ~ 254 by the user, the smaller the value is, the more stable the data is, but it may cause data lag; when it is set to 1, the filtering effect is the strongest, and when it is set to 254, the filtering effect is the weakest, and the default value is 0 (no filtering).

3. When the module flag bit 
is set on, please monitor X but not Y, as Y is channel enable bit.

For example: When the first channel of AD is set to voltage mode and AD detects short circuit / open circuit / over range, X10000 will be set to on;

The first channel of AD is set to current mode. When AD is detected as over range, X10000 will be set to on.

Flash registers:

The working mode can be voltage 0~5V, 0~10V or current 0~20mA, 4~20mA, set through SFD registers of PLC:

Module no.	SFD address	Module no.	SFD address
#1	SFD350~SFD359	#9	SFD430~SFD439
#2	SFD360~SFD369	#10	SFD440~SFD449
#3	SFD370~SFD379	#11	SFD450~SFD459
#4	SFD380~SFD389	#12	SFD460~SFD469
#5	SFD390~SFD399	#13	SFD470~SFD479
#6	SFD400~SFD409	#14	SFD480~SFD489
#7	SFD410~SFD419	#15	SFD490~SFD499
#8	SFD420~SFD429	#16	SFD500~SFD509

Note: As shown in the preceding table, every register set 4 channels mode, each register has 16 bits, from low to high, and every 4 bits set 1 channel mode.

We take module 1 as an example to show how to set:

<table>
<tr><th colspan="2">Register</th><th>Bit7</th><th>Bit6</th><th>Bit5</th><th>Bit4</th><th>Bit3</th><th>Bit2</th><th>Bit1</th><th>Bit0</th><th>Note</th></tr>
<tr><td rowspan="2">SFD350</td><td>Byte0</td><td colspan="8">AD channel 1, 2 filtering coefficient</td><td rowspan="2">AD filtering coefficient</td></tr>
<tr><td>Byte1</td><td colspan="8">AD channel 3, 4 filtering coefficient</td></tr>
<tr><td rowspan="4">SFD351</td><td rowspan="2">Byte2</td><td>Bit7</td><td>Bit6</td><td>Bit5</td><td>Bit4</td><td>Bit3</td><td>Bit2</td><td>Bit1</td><td>Bit0</td><td rowspan="4">To set the input range of AD module. Byte2 low 4-bit is to set AD channel 1, high 4-bit is to set AD</td></tr>
<tr><td colspan="4">AD2</td><td colspan="4">AD1</td></tr>
<tr><td>-</td><td colspan="3">000：0~10V
001：0~5V
100：-10~10V
101：-5~5V
010：0~20mA
011：4~20mA
110：-20~20mA</td><td>-</td><td colspan="3">000：0~10V
001：0~5V
100：-10~10V
101：-5~5V
010：0~20mA
011：4~20mA
110：-20~20mA</td></tr>
<tr><td rowspan="2">Byte3</td><td>Bit7</td><td>Bit6</td><td>Bit5</td><td>Bit4</td><td>Bit3</td><td>Bit2</td><td>Bit1</td><td>Bit0</td></tr>
<tr><td colspan="4">AD4</td><td colspan="4">AD3</td></tr>
</table>

		-	000：0~10V 001：0~5V 100：-10~10V 101：-5~5V 010：0~20mA 011：4~20mA 110：-20~20mA	-	000：0~10V 001：0~5V 100：-10~10V 101：-5~5V 010：0~20mA 011：4~20mA 110：-20~20mA	channel 2. Byte3 Low 4-bit is to set AD channel 3, high 4-bit is to set AD channel 4.
SFD352	Byte4	AD channel short circuit/open circuit/over range detection switch				
	Byte5	-				
SFD353~SFD359		-				

For example:

Set module no. 1 channel 3, 2, 1, 0 working mode to 0~20mA, 4~20mA, 0~10V, 0~5V. Set channel 1 and channel 2 filter factor to 254, set channel 3 and channel 4 filter factor to 100.

So the SFD values are:

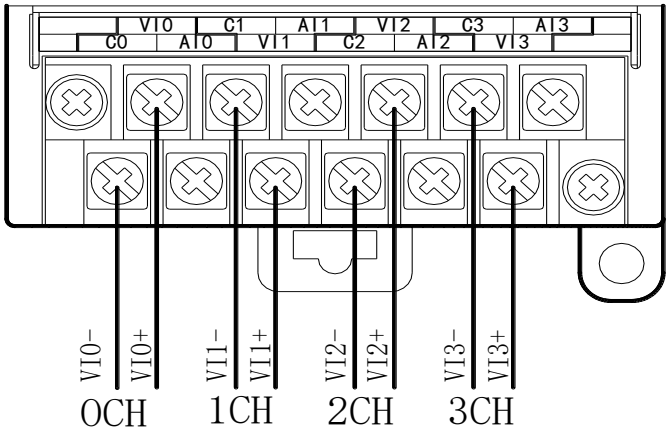
SFD350=64FEH SFD351=2301H SFD352=0000H SFD353=0000H

4-5. Exterior connection

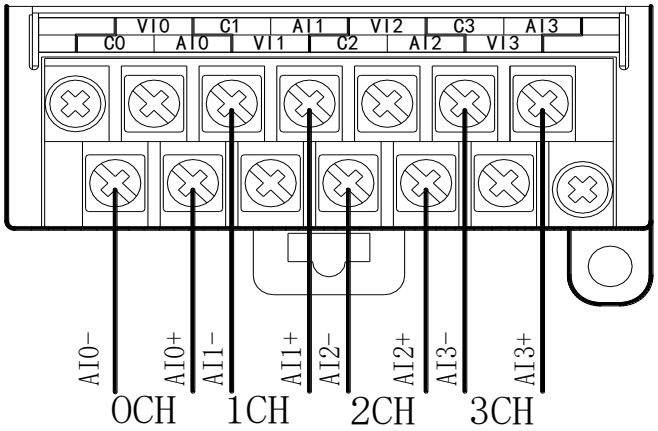
When make external connection, please note the following items:

- When connect external 24V power, please choose 24V power of PLC to avoid interference.
- To avoid interference, please use shield cable and single-point ground with the shield layer.

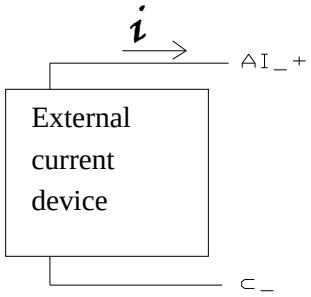
Voltage input



Current input



XD-E4AD current input wiring:



4-6. AD conversion diagram

The relationship between analog input and converted digital value is shown in the following chart:

0~5V analog input	0~10V analog input
	-5~5V analog input	-10~10V analog input
	0~20mA analog input	4~20mA analog input

<table>
<tr><td> </td><td> </td></tr>
<tr><td>-20~20mA analog input</td><td></td></tr>
<tr><td> </td><td></td></tr>
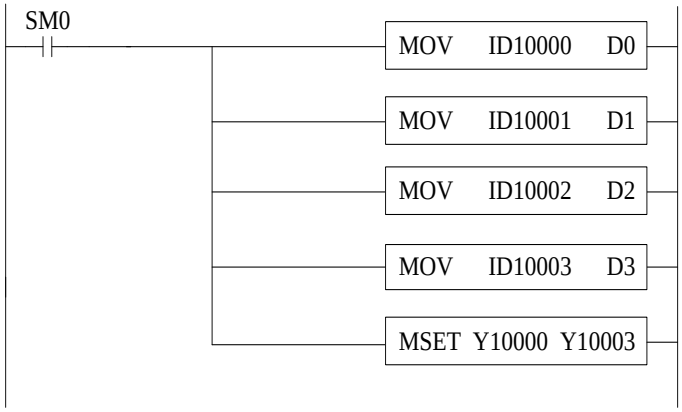
</table>

4-7. Programming

Example Real-time read the 4 channels data (take expansion 1 as an example)

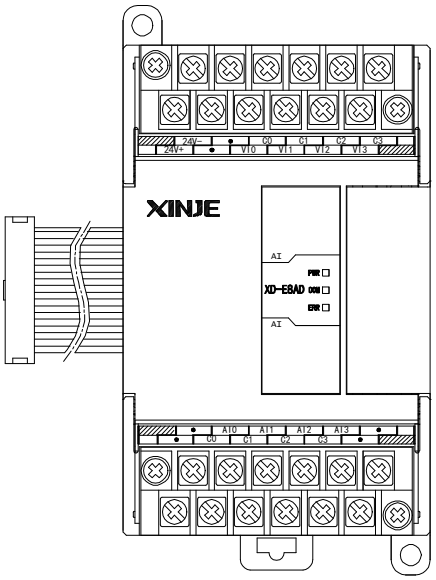


Explanation:
SM0 is always ON coil, it is ON when PLC is running.
Send channel 0 data to PLC register D0,
Send channel 1 data to PLC register D1,
Send channel 2 data to PLC register D2,
Send channel 3 data to PLC register D3.
Set ON all the channel enable bits.

5. Analog input module XD-E8AD

5-1. Specification

XD-E8AD transform the analog value (current or voltage input) to digital value and send to PLC registers.



Features:

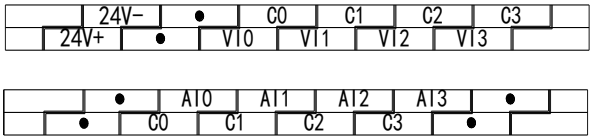
- 8-channel analog input: first 4-channel voltage input, last 4-channel current input.
- 14-bit high precision analog input.
- As a special function module of XD series, XD3 can connect up to 10 modules on the right side of PLC main unit, XD5/XDM/XDC/XD5E/XDME can expand 16 modules, XD1/XD2 does not support expansion modules.

Specifications:

Items	Voltage input (0CH~3CH)	Current input (4CH~7CH)
Analog input range	0~5V, 0~10V, -10~10V, -5~5V (impedance > 1M)	0~20mA, 4~20mA, -20~20mA (impedance is about 120 Ω)
Max input range	DC±15V	-40~40mA
Digital output range	14 bits binary data (0~16383 or -8192~8191)	
Resolution	1/16383(14Bit)	
Integrate Precision	±1%	
Conversion speed	2ms per channel	
Analog power supply	DC24V ±10%,150mA	
Installation	Can be fixed with screw M3 or directly installed on orbit of DIN46277 (width: 35mm)	
Dimension	63mm×108mm×89.9mm	

Note: XD-E8AD module below version V8 does not support -5~5V, -10~10V, -20~20mA input.

5-2. Terminals



Channel	Terminal name	Signal name
CH0	VI0	VI0+ voltage input
	C0	VI0- voltage input
CH1	VI1	VI1+ voltage input
	C1	VI1- voltage input
CH2	VI2	VI2+ voltage input
	C2	VI2- voltage input
CH3	VI3	VI3+ voltage input
	C3	VI3- voltage input
CH4	AI0	AI0+current input
	C0	AI0- current input
CH5	AI1	AI1+ current input
	C1	AI1- current input
CH6	AI2	AI2+ current input
	C2	AI2- current input
CH7	AI3	AI3+ current input
	C3	AI3- current input
-	24V+	+24Vpower supply
	24V-	Common terminal of power supply

5-3. I/O distribution

XD series analog expansion modules don’t occupy I/O unit; the converted data is directly transferred to PLC register.

Note: each channel can only be used when the enable bit is turned on.

Each channel address:

I/O address list

Register address of expansion module 1:

Channel	AD signal	Channel enable (set ON the enable bit to use this channel)	Channel alarm bit
0CH	ID10000	Y10000	X10000
1CH	ID10001	Y10001	X10001
2CH	ID10002	Y10002	X10002
3CH	ID10003	Y10003	X10003
4CH	ID10004	Y10004	X10004
5CH	ID10005	Y10005	X10005
6CH	ID10006	Y10006	X10006
7CH	ID10007	Y10007	X10007

Register address of expansion module 2:

Channel	AD signal	Channel enable (set ON the enable bit to use this channel)	Channel alarm bit
0CH	ID10100	Y10100	X10100
1CH	ID10101	Y10101	X10101
2CH	ID10102	Y10102	X10102
3CH	ID10103	Y10103	X10103
4CH	ID10104	Y10104	X10104
5CH	ID10105	Y10105	X10105
6CH	ID10106	Y10106	X10106
7CH	ID10107	Y10107	X10107

Register address of expansion module 3:

Channel	AD signal	Channel enable (set ON the enable bit to use this channel)	Channel alarm bit
0CH	ID10200	Y10200	X10200
1CH	ID10201	Y10201	X10201
2CH	ID10202	Y10202	X10202
3CH	ID10203	Y10203	X10203
4CH	ID10204	Y10204	X10204
5CH	ID10205	Y10205	X10205
6CH	ID10206	Y10206	X10206
7CH	ID10207	Y10207	X10207

Register address of expansion module 4:

Channel	AD signal	Channel enable (set ON the enable bit to use this channel)	Channel alarm bit
0CH	ID10300	Y10300	X10300
1CH	ID10301	Y10301	X10301
2CH	ID10302	Y10302	X10302
3CH	ID10303	Y10303	X10303
4CH	ID10304	Y10304	X10304
5CH	ID10305	Y10305	X10305
6CH	ID10306	Y10306	X10306
7CH	ID10307	Y10307	X10307

Register address of expansion module 5:

Channel	AD signal	Channel enable (set ON the enable bit to use this channel)	Channel alarm bit
0CH	ID10400	Y10400	X10400
1CH	ID10401	Y10401	X10401
2CH	ID10402	Y10402	X10402
3CH	ID10403	Y10403	X10403
4CH	ID10404	Y10404	X10404
5CH	ID10405	Y10405	X10405
6CH	ID10406	Y10406	X10406
7CH	ID10407	Y10407	X10407

Register address of expansion module 6:

Channel	AD signal	Channel enable (set ON the enable bit to use this channel)	Channel alarm bit
0CH	ID10500	Y10500	X10500
1CH	ID10501	Y10501	X10501
2CH	ID10502	Y10502	X10502
3CH	ID10503	Y10503	X10503
4CH	ID10504	Y10504	X10504
5CH	ID10505	Y10505	X10505
6CH	ID10506	Y10506	X10506

7CH	ID10507	Y10507	X10507

Register address of expansion module 7:

Channel	AD signal	Channel enable (set ON the enable bit to use this channel)	Channel alarm bit
0CH	ID10600	Y10600	X10600
1CH	ID10601	Y10601	X10601
2CH	ID10602	Y10602	X10602
3CH	ID10603	Y10603	X10603
4CH	ID10604	Y10604	X10604
5CH	ID10605	Y10605	X10605
6CH	ID10606	Y10606	X10606
7CH	ID10607	Y10607	X10607

Register address of expansion module 8:

Channel	AD signal	Channel enable (set ON the enable bit to use this channel)	Channel alarm bit
0CH	ID10700	Y10700	X10700
1CH	ID10701	Y10701	X10701
2CH	ID10702	Y10702	X10702
3CH	ID10703	Y10703	X10703
4CH	ID10704	Y10704	X10704
5CH	ID10705	Y10705	X10705
6CH	ID10706	Y10706	X10706
7CH	ID10707	Y10707	X10707

Register address of expansion module 9:

Channel	AD signal	Channel enable (set ON the enable bit to use this channel)	Channel alarm bit
0CH	ID10800	Y11000	X11000
1CH	ID10801	Y11001	X11001
2CH	ID10802	Y11002	X11002
3CH	ID10803	Y11003	X11003
4CH	ID10804	Y11004	X11004
5CH	ID10805	Y11005	X11005

6CH	ID10806	Y11006	X11006
7CH	ID10807	Y11007	X11007

Register address of expansion module 10:

Channel	AD signal	Channel enable (set ON the enable bit to use this channel)	Channel alarm bit
0CH	ID10900	Y11100	X11100
1CH	ID10901	Y11101	X11101
2CH	ID10902	Y11102	X11102
3CH	ID10903	Y11103	X11103
4CH	ID10904	Y11104	X11104
5CH	ID10905	Y11105	X11105
6CH	ID10906	Y11106	X11106
7CH	ID10907	Y11107	X11107

Register address of expansion module 11:

Channel	AD signal	Channel enable (set ON the enable bit to use this channel)	Channel alarm bit
0CH	ID11000	Y11200	X11200
1CH	ID11001	Y11201	X11201
2CH	ID11002	Y11202	X11202
3CH	ID11003	Y11203	X11203
4CH	ID11004	Y11204	X11204
5CH	ID11005	Y11205	X11205
6CH	ID11006	Y11206	X11206
7CH	ID11007	Y11207	X11207

Register address of expansion module 12:

Channel	AD signal	Channel enable (set ON the enable bit to use this channel)	Channel alarm bit
0CH	ID11100	Y11300	X11300
1CH	ID11101	Y11301	X11301
2CH	ID11102	Y11302	X11302
3CH	ID11103	Y11303	X11303
4CH	ID11104	Y11304	X11304

5CH	ID11105	Y11305	X11305
6CH	ID11106	Y11306	X11306
7CH	ID11107	Y11307	X11307

Register address of expansion module 13:

Channel	AD signal	Channel enable (set ON the enable bit to use this channel)	Channel alarm bit
0CH	ID11200	Y11400	X11400
1CH	ID11201	Y11401	X11401
2CH	ID11202	Y11402	X11402
3CH	ID11203	Y11403	X11403
4CH	ID11204	Y11404	X11404
5CH	ID11205	Y11405	X11405
6CH	ID11206	Y11406	X11406
7CH	ID11207	Y11407	X11407

Register address of expansion module 14:

Channel	AD signal	Channel enable (set ON the enable bit to use this channel)	Channel alarm bit
0CH	ID11300	Y11500	X11500
1CH	ID11301	Y11501	X11501
2CH	ID11302	Y11502	X11502
3CH	ID11303	Y11503	X11503
4CH	ID11304	Y11504	X11504
5CH	ID11305	Y11505	X11505
6CH	ID11306	Y11506	X11506
7CH	ID11307	Y11507	X11507

Register address of expansion module 15:

Channel	AD signal	Channel enable (set ON the enable bit to use this channel)	Channel alarm bit
0CH	ID11400	Y11600	X11600
1CH	ID11401	Y11601	X11601
2CH	ID11402	Y11602	X11602
3CH	ID11403	Y11603	X11603
4CH	ID11404	Y11604	X11604
5CH	ID11405	Y11605	X11605
6CH	ID11406	Y11606	X11606
7CH	ID11407	Y11607	X11607

Register address of expansion module 16:

Channel	AD signal	Channel enable (set ON the enable bit to use this channel)	Channel alarm bit
0CH	ID11500	Y11700	X11700
1CH	ID11501	Y11701	X11701
2CH	ID11502	Y11702	X11702
3CH	ID11503	Y11703	X11703
4CH	ID11504	Y11704	X11704
5CH	ID11505	Y11705	X11705
6CH	ID11506	Y11706	X11706
7CH	ID11507	Y11707	X11707

Note:

1. Forbid the unused channel to improve the I/O scanning speed.
2. If set off the enable bit of the channel, this channel will not accept the data. (the data display is 0).

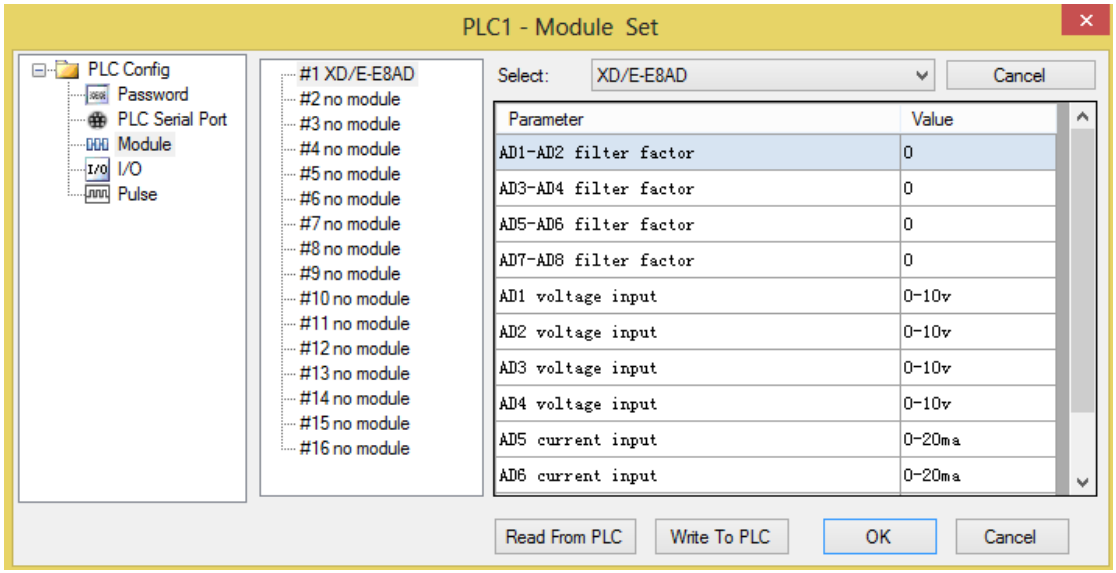
5-4. Working mode

There are two ways to set the working mode:

1. XDPpro software
2. Flash registers of PLC

XDPpro software:

Open the XDPpro software, click configure/expansion module settings:
Set the model and channel parameters in the following window. Then click write to PLC.
Please restart the PLC after setting.
Note:
1. The first-order low-pass filtering method uses this sampling value and the last filtering output value for weighting to get the effective filtering value.
2. The filter coefficient is set to 0 ~ 254 by the user, the smaller the value is, the more stable the data is, but it may cause data lag; when it is set to 1, the filtering effect is the strongest, and when it is set to 254, the filtering effect is the weakest, and the default value is 0 (no filtering).
3. When the module flag bit 
is set on, please monitor X but not Y, as Y is channel enable bit.
For example: When the first channel of AD is set to voltage mode and AD detects short circuit / open circuit / over range, X10000 will be set to on;
The fifth channel of AD is set to current mode. When AD is detected as over range, X10004 will be set to on.



Flash registers:
0CH~3CH channels: voltage 0～5V, 0～10V, -5～5V, -10～10V.
4CH~7CH channels: current 0~20mA, 4~20mA, -20~20mA.
Set the modes through SFD registers of PLC. See the following table:

Module no.	SFD address	Module no.	SFD address
#1	SFD350~SFD359	#9	SFD430~SFD439
#2	SFD360~SFD369	#10	SFD440~SFD449
#3	SFD370~SFD379	#11	SFD450~SFD459

#4	SFD380~SFD389	#12	SFD460~SFD469
#5	SFD390~SFD399	#13	SFD470~SFD479
#6	SFD400~SFD409	#14	SFD480~SFD489
#7	SFD410~SFD419	#15	SFD490~SFD499
#8	SFD420~SFD429	#16	SFD500~SFD509

Note: each SFD register can set 4 channels mode. Each register has 16 bits, every 4 bits set one channel mode.

SFD bit definition:

<table>
<tr><th colspan="2" rowspan="2">Register</th><th>Bit7</th><th>Bit6</th><th>Bit5</th><th>Bit4</th><th>Bit3</th><th>Bit2</th><th>Bit1</th><th>Bit0</th><th rowspan="2">Note</th></tr>

<tr><td colspan="4">AD8</td><td colspan="4">AD7</td></tr>
</table>

		1000：0~20mA 1001：4~20mA 1010：-20~20mA	1000：0~20mA 1001：4~20mA 1010：-20~20mA	
SFD354	Byte8	AD channel short circuit/open circuit/over range detection switch		
	Byte9	-		
SFD355~ SFD359		-		

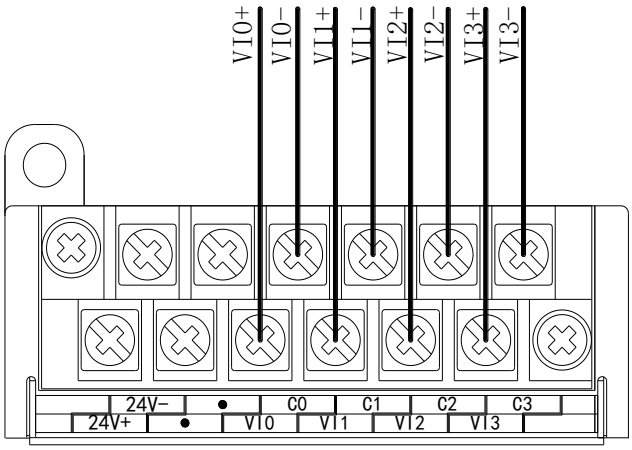
For example: set module no.1 channel 1 and channel 0 mode to 0~10V. Set channel 3 and channel 2 mode to 0~5V. Set channel 5 and channel 4 mode to 0~20mA. Set channel 7 and channel 6 mode to 4~20mA. The filter factor of channel 0 to channel 3 is 254. The filter factor of channel 4 to channel 7 is 100.
Then the SFD350=FFFEH SFD351=6464H SFD352=1100H SFD353=1100H

5-5. Exterior connection

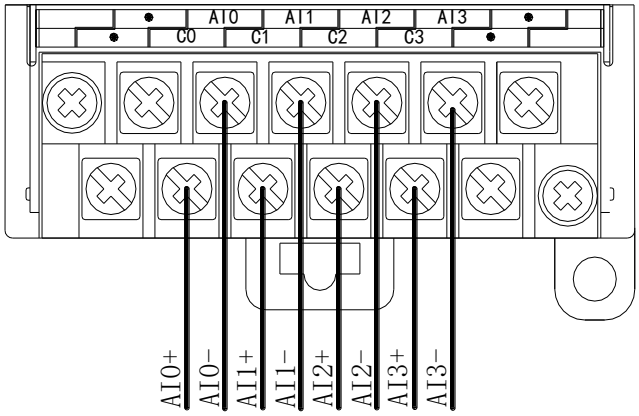
Notes:

- When connect external＋24V power, please use the 24V power of PLC to avoid interference.
- To avoid interference, please use shield cable and single point ground for the shield layer.

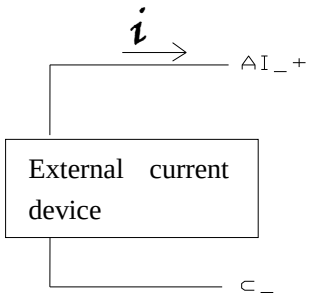
Voltage input:



Current input:



XD-E8AD current input wiring:



5-6. AD conversion diagram

The relationship between analog value and digital value is shown as the following diagram:

0~5V analog input	0~10V analog input
	-5~5V analog input	-10~10V analog input
	0~20mA analog input	4~20mA analog input

<table>
<tr><td> </td><td> </td></tr>
<tr><td>-20~20mA analog input</td><td></td></tr>
<tr><td> </td><td></td></tr>
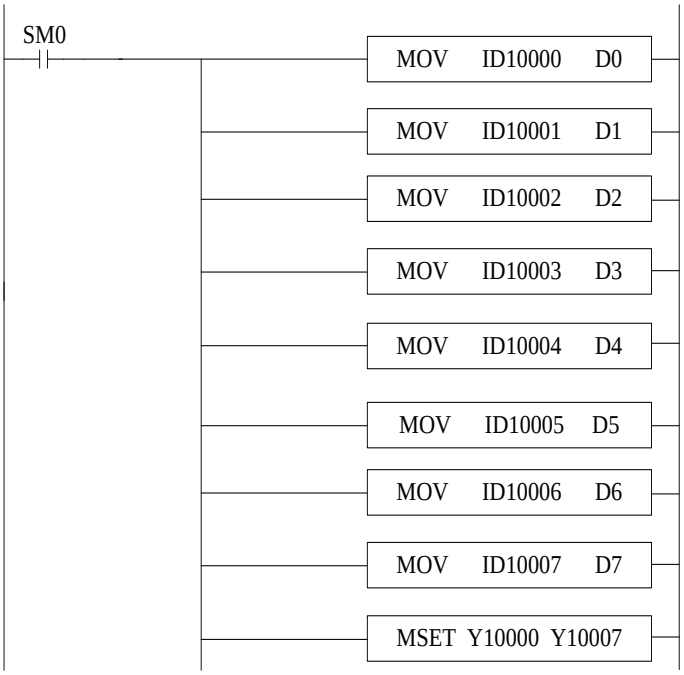
</table>

5-7. Program application

Real-time read the data of the 8 channels (module no.1)



Explanation:

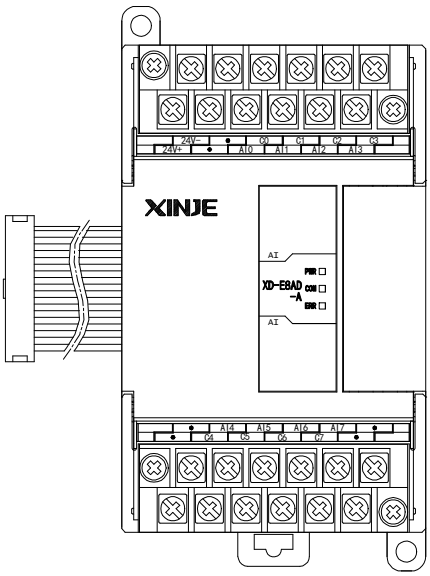
SM0 is always ON coil.

PLC is running. PLC keeps on writing channel 0 data to D0, channel 1 data to D1, channel 2 data to D2, channel 3 data to D3, channel 4 data to D4, channel 5 data to D5, channel 6 data to D6, channel 7 data to D7. Set ON all the channels enable bits.

6. Analog input module XD-E8AD-A

6-1. Specification

XD-E8AD-A transform the analog value (current input) to digital value and send to PLC registers.



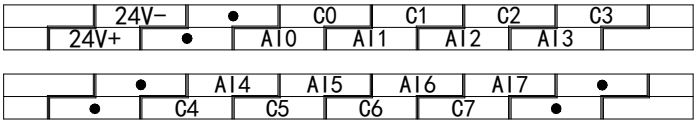
Features:

- 8-channel analog input: current input.
- 14-bit high precision analog input.
- As a special function module of XD series, XD3 can connect up to 10 modules on the right side of PLC main unit, XD5/XDM/XDC/ XD5E/XDME can expand 16 modules, XD1/XD2 does not support expansion modules.

Specifications:

Items	Current input
Analog input range	0~20mA, 4~20mA, -20~20mA (impedance is about 120Ω)
Max input range	-40~40mA
Digital output range	14 bits binary data (0~16383 or -8192~8191)
Resolution	1/16383(14Bit)
Integrate Precision	±1%
Conversion speed	2ms per channel
Analog power supply	DC24V ±10%,150mA
Installation	Can be fixed with screw M3 or directly installed on orbit of DIN46277 (width: 35mm)
Dimension	63mm×108mm×89.9mm

6-2. Terminals



Channel	Terminal name	Signal name
CH0	AI0	Current input
	C0	CH0 input common terminal
CH1	AI1	Current input
	C1	CH1 input common terminal
CH2	AI2	Current input
	C2	CH2 input common terminal
CH3	AI3	Current input
	C3	CH3 input common terminal
CH4	AI4	Current input
	C4	CH4 input common terminal
CH5	AI5	Current input
	C5	CH5 input common terminal
CH6	AI6	Current input
	C6	CH6 input common terminal
CH7	AI7	Current input
	C7	CH7 input common terminal
-	24V+	+24Vpower supply
	24V-	Common terminal of power supply

6-3. I/O distribution

XD series analog expansion modules don’t occupy I/O unit; the converted data is directly transferred to PLC register. Each channel address:

Note: each channel can only be used when the enable bit is turned on.

I/O address list

Register address of expansion module 1:

Channel	AD signal	Channel enable (set ON the enable bit to use this channel)	Channel alarm bit
0CH	ID10000	Y10000	X10000
1CH	ID10001	Y10001	X10001
2CH	ID10002	Y10002	X10002
3CH	ID10003	Y10003	X10003
4CH	ID10004	Y10004	X10004
5CH	ID10005	Y10005	X10005
6CH	ID10006	Y10006	X10006
7CH	ID10007	Y10007	X10007

Register address of expansion module 2:

Channel	AD signal	Channel enable (set ON the enable bit to use this channel)	Channel alarm bit
0CH	ID10100	Y10100	X10100
1CH	ID10101	Y10101	X10101
2CH	ID10102	Y10102	X10102
3CH	ID10103	Y10103	X10103
4CH	ID10104	Y10104	X10104
5CH	ID10105	Y10105	X10105
6CH	ID10106	Y10106	X10106
7CH	ID10107	Y10107	X10107

Register address of expansion module 3:

Channel	AD signal	Channel enable (set ON the enable bit to use this channel)	Channel alarm bit
0CH	ID10200	Y10200	X10200
1CH	ID10201	Y10201	X10201
2CH	ID10202	Y10202	X10202
3CH	ID10203	Y10203	X10203
4CH	ID10204	Y10204	X10204
5CH	ID10205	Y10205	X10205
6CH	ID10206	Y10206	X10206
7CH	ID10207	Y10207	X10207

Register address of expansion module 4:

Channel	AD signal	Channel enable (set ON the enable bit to use this channel)	Channel alarm bit

6CH	ID11306	Y11506	X11506
7CH	ID11307	Y11507	X11507

Register address of expansion module 15:

Channel	AD signal	Channel enable (set ON the enable bit to use this channel)	Channel alarm bit
0CH	ID11400	Y11600	X11600
1CH	ID11401	Y11601	X11601
2CH	ID11402	Y11602	X11602
3CH	ID11403	Y11603	X11603
4CH	ID11404	Y11604	X11604
5CH	ID11405	Y11605	X11605
6CH	ID11406	Y11606	X11606
7CH	ID11407	Y11607	X11607

Register address of expansion module 16:

Channel	AD signal	Channel enable (set ON the enable bit to use this channel)	Channel alarm bit
0CH	ID11500	Y11700	X11700
1CH	ID11501	Y11701	X11701
2CH	ID11502	Y11702	X11702
3CH	ID11503	Y11703	X11703
4CH	ID11504	Y11704	X11704
5CH	ID11505	Y11705	X11705
6CH	ID11506	Y11706	X11706
7CH	ID11507	Y11707	X11707

Note:

1. Forbid the unused channel to improve the I/O scanning speed.
2. If set off the enable bit of the channel, this channel will not accept the data. (the data display is 0).

6-4. Working mode

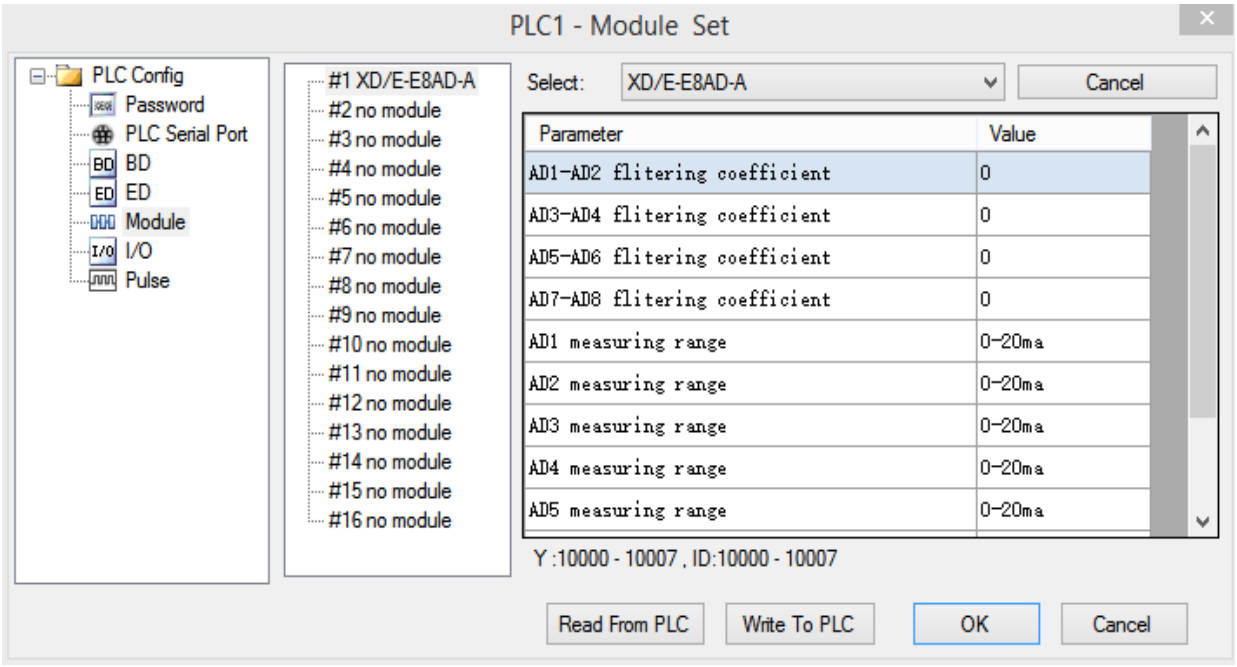
There are two ways to set the working mode:

1. XDPpro software
2. Flash registers of PLC

XDPpro software:

Open the XDPpro software, click configure/expansion module settings:
Set the model and channel parameters in the following window. Then click write to PLC.
Please restart the PLC after setting.

Note:
1. The first-order low-pass filtering method uses this sampling value and the last filtering output value for weighting to get the effective filtering value.
2. The filter coefficient is set to 0 ~ 254 by the user, the smaller the value is, the more stable the data is, but it may cause data lag; when it is set to 1, the filtering effect is the strongest, and when it is set to 254, the filtering effect is the weakest, and the default value is 0 (no filtering).
3. When the module flag bit 
is set on, please monitor X but not Y, as Y is channel enable bit.
For example, AD channel 1 is current mode, AD detection is over range, X10000 will be ON.



Flash registers:
The module input is current mode, the current range include 0~20mA, 4~20mA, -20~20mA. Set the modes through SFD registers of PLC. See the following table:

Module no.	SFD address	Module no.	SFD address
#1	SFD350~SFD359	#9	SFD430~SFD439
#2	SFD360~SFD369	#10	SFD440~SFD449
#3	SFD370~SFD379	#11	SFD450~SFD459

#4	SFD380~SFD389	#12	SFD460~SFD469
#5	SFD390~SFD399	#13	SFD470~SFD479
#6	SFD400~SFD409	#14	SFD480~SFD489
#7	SFD410~SFD419	#15	SFD490~SFD499
#8	SFD420~SFD429	#16	SFD500~SFD509

Note: each SFD register can set 4 channels mode. Each register has 16 bits, every 4 bits set one channel mode.

SFD bit definition:

<table>
<tr><th colspan="2" rowspan="2">Register</th><th>Bit7</th><th>Bit6</th><th>Bit5</th><th>Bit4</th><th>Bit3</th><th>Bit2</th><th>Bit1</th><th>Bit0</th><th>Note</th></tr>
<tr><td colspan="8">AD channel 2, 1 filtering coefficient</td><td rowspan="5">AD filtering coefficient</td></tr>
<tr><td>SFD350</td><td>Byte0</td><td colspan="8">AD channel 4, 3 filtering coefficient</td></tr>
<tr><td>SFD351</td><td>Byte1</td><td colspan="8">AD channel 6, 5 filtering coefficient</td></tr>
<tr><td></td><td>Byte2</td><td colspan="8">AD channel 8, 7 filtering coefficient</td></tr>
<tr><td></td><td>Byte3</td><td colspan="8"></td></tr>
<tr><td rowspan="6">SFD352</td><td rowspan="2">Byte4</td><td>Bit7</td><td>Bit6</td><td>Bit5</td><td>Bit4</td><td>Bit3</td><td>Bit2</td><td>Bit1</td><td>Bit0</td><td rowspan="6">To define the AD input range.
Byte4 low 4 bits set channel 1 mode, high 4 bits set channel 2 mode.
Byte5 low 4 bits set channel 3 mode, high 4 bits set channel 4 mode.
Byte6 low 4 bits set channel 5 mode, high 4 bits set channel 6 mode.
Byte7 low 4 bits set</td></tr>
<tr><td colspan="4">AD2</td><td colspan="4">AD1</td></tr>
<tr><td colspan="4">1000：0~20mA
1001：4~20mA

1001：4~20mA
1010：-20~20mA</td></tr>
<tr><td rowspan="3">SFD353</td><td rowspan="3">Byte6</td><td>Bit7</td><td>Bit6</td><td>Bit5</td><td>Bit4</td><td>Bit3</td><td>Bit2</td><td>Bit1</td><td>Bit0</td></tr>
<tr><td colspan="4">AD6</td><td colspan="4">AD5</td></tr>
<tr><td colspan="4"></td><td colspan="4"></td></tr>
</table>

<table>
<tr><td rowspan="5"></td><td></td><td colspan="4">1000：0~20mA
1001：4~20mA
1010：-20~20mA</td><td colspan="4">1000：0~20mA
1001：4~20mA
1010：-20~20mA</td><td rowspan="5">channel 7 mode, high 4 bits set channel 8 mode.</td></tr>
<tr><td rowspan="3">Byte7</td><td>Bit7</td><td>Bit6</td><td>Bit5</td><td>Bit4</td><td>Bit3</td><td>Bit2</td><td>Bit1</td><td>Bit0</td></tr>
<tr><td colspan="4">AD8</td><td colspan="4">AD7</td></tr>
<tr><td colspan="4">1000：0~20mA
1001：4~20mA
1010：-20~20mA</td><td colspan="4">1000：0~20mA
1001：4~20mA
1010：-20~20mA</td></tr>
<tr><td rowspan="2">SFD354</td><td>Byte8</td><td colspan="8">AD channel short circuit/open circuit/over range detection switch</td></tr>
<tr><td>Byte9</td><td colspan="8">-</td></tr>
<tr><td colspan="2">SFD355~
SFD359</td><td colspan="8">-</td></tr>
</table>

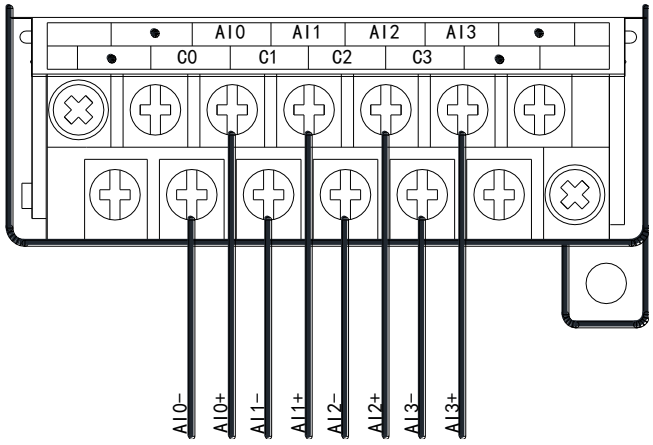
For example: set module no.1 channel 1 and channel 0 mode to 0~20mA. Set channel 3 and channel 2 mode to 4~20mA. Set channel 5 and channel 4 mode to 0~20mA. Set channel 7 and channel 6 mode to -20~20mA. The filter factor of channel 0 to channel 3 is 254. The filter factor of channel 4 to channel 7 is 100.
Then the SFD350=FEFEH SFD351=6464H SFD352=98H SFD353=A8H

6-5. Exterior connection

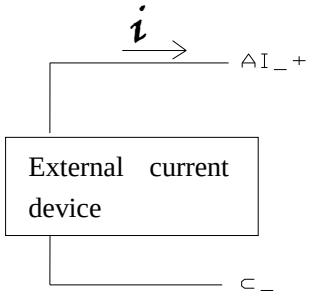
Notes:

- When connect external＋24V power, please use the 24V power of PLC to avoid interference.
- To avoid interference, please use shield cable and single point ground for the shield layer.

Current input:



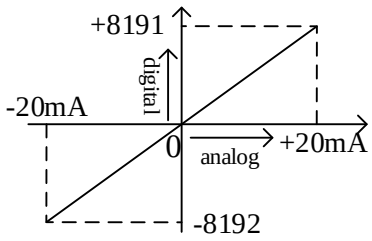
XD-E8AD-A current input wiring:



6-6. AD conversion diagram

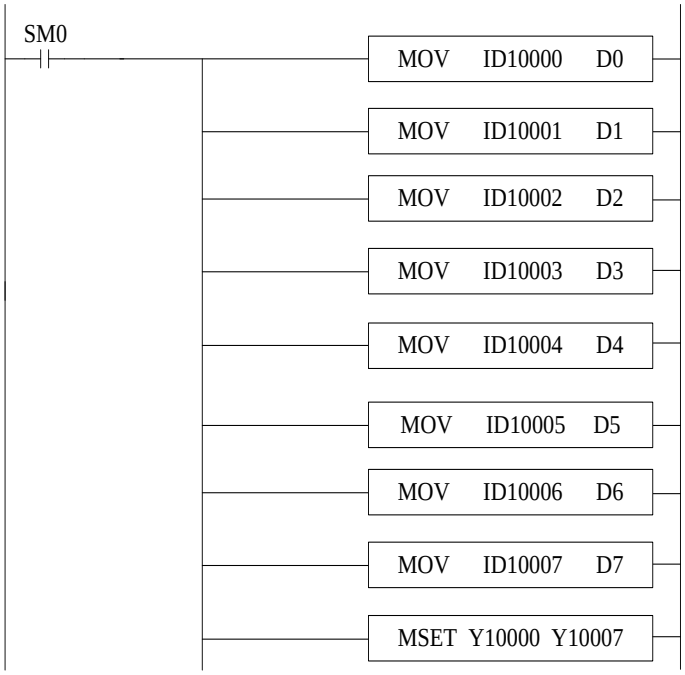
The relationship between analog value and digital value is shown as the following diagram:

0~20mA current input	4~20mA current input
	-20~20mA current input	
	



6-7. Program application

Real-time read the data of the 8 channels (module no.1)



Explanation:

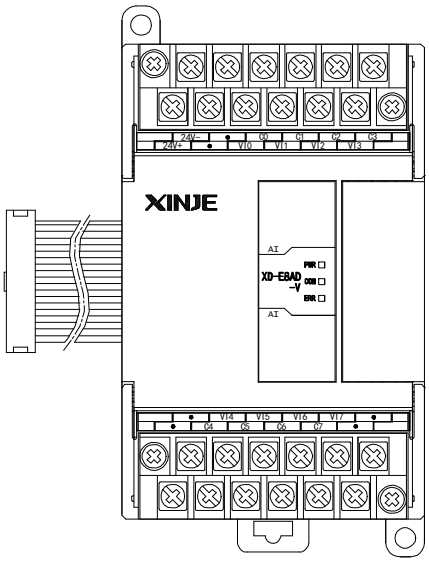
SM0 is always ON coil.

PLC is running. PLC keeps on writing channel 0 data to D0, channel 1 data to D1, channel 2 data to D2, channel 3 data to D3, channel 4 data to D4, channel 5 data to D5, channel 6 data to D6, channel 7 data to D7. Set ON all the channels enable bits.

7. Analog input module XD-E8AD-V

7-1. Specification

XD-E8AD-V transform the analog value (voltage input) to digital value and send to PLC registers.



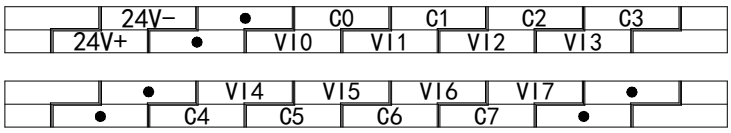
Features:

- 8-channel analog input: voltage input.
- 14-bit high precision analog input.
- As a special function module of XD series, XD3 can connect up to 10 modules on the right side of PLC main unit, XD5/XDM/XDC/ XD5E/XDME can expand 16 modules, XD1/XD2 does not support expansion modules.

Specifications:

Items	Voltage input
Analog input range	0~5V, 0~10V, -10~10V, -5~5V (impedance > 1M)
Max input range	DC±15V
Digital output range	14 bits binary data (0~16383 or -8192~8191)
Resolution	1/16383(14Bit)
Integrate Precision	±1%
Conversion speed	2ms per channel
Analog power supply	DC24V ±10%,150mA
Installation	Can be fixed with screw M3 or directly installed on orbit of DIN46277 (width: 35mm)
Dimension	63mm×108mm×89.9mm

7-2. Terminals



Channel	Terminal name	Signal name
CH0	VI0	voltage input
	C0	CH0 analog input common terminal
CH1	VI1	voltage input
	C1	CH1 analog input common terminal
CH2	VI2	voltage input
	C2	CH2 analog input common terminal
CH3	VI3	voltage input
	C3	CH3 analog input common terminal
CH4	VI4	voltage input
	C4	CH4 analog input common terminal
CH5	VI5	voltage input
	C5	CH5 analog input common terminal
CH6	VI6	voltage input
	C6	CH6 analog input common terminal
CH7	VI7	voltage input
	C7	CH7 analog input common terminal
-	24V+	+24Vpower supply
	24V-	Common terminal of power supply

7-3. I/O distribution

XD series analog expansion modules don’t occupy I/O unit; the converted data is directly transferred to PLC register. Each channel address:

Note: each channel can only be used when the enable bit is turned on.

I/O address list

Register address of expansion module 1:

Channel	AD signal	Channel enable (set ON the enable bit to use this channel)	Channel alarm bit
0CH	ID10000	Y10000	X10000
1CH	ID10001	Y10001	X10001
2CH	ID10002	Y10002	X10002
3CH	ID10003	Y10003	X10003
4CH	ID10004	Y10004	X10004
5CH	ID10005	Y10005	X10005
6CH	ID10006	Y10006	X10006
7CH	ID10007	Y10007	X10007

Register address of expansion module 2:

Channel	AD signal	Channel enable (set ON the enable bit to use this channel)	Channel alarm bit
0CH	ID10100	Y10100	X10100
1CH	ID10101	Y10101	X10101
2CH	ID10102	Y10102	X10102
3CH	ID10103	Y10103	X10103
4CH	ID10104	Y10104	X10104
5CH	ID10105	Y10105	X10105
6CH	ID10106	Y10106	X10106
7CH	ID10107	Y10107	X10107

Register address of expansion module 3:

Channel	AD signal	Channel enable (set ON the enable bit to use this channel)	Channel alarm bit
0CH	ID10200	Y10200	X10200
1CH	ID10201	Y10201	X10201
2CH	ID10202	Y10202	X10202
3CH	ID10203	Y10203	X10203
4CH	ID10204	Y10204	X10204
5CH	ID10205	Y10205	X10205
6CH	ID10206	Y10206	X10206
7CH	ID10207	Y10207	X10207

Register address of expansion module 4:

Channel	AD signal	Channel enable (set ON the enable bit to use this channel)	Channel alarm bit
0CH	ID10300	Y10300	X10300
1CH	ID10301	Y10301	X10301
2CH	ID10302	Y10302	X10302
3CH	ID10303	Y10303	X10303
4CH	ID10304	Y10304	X10304
5CH	ID10305	Y10305	X10305
6CH	ID10306	Y10306	X10306
7CH	ID10307	Y10307	X10307

Register address of expansion module 5:

Channel	AD signal	Channel enable (set ON the enable bit to use this channel)	Channel alarm bit

3CH	ID11403	Y11603	X11603
4CH	ID11404	Y11604	X11604
5CH	ID11405	Y11605	X11605
6CH	ID11406	Y11606	X11606
7CH	ID11407	Y11607	X11607

Register address of expansion module 16:

Channel	AD signal	Channel enable (set ON the enable bit to use this channel)	Channel alarm bit
0CH	ID11500	Y11700	X11700
1CH	ID11501	Y11701	X11701
2CH	ID11502	Y11702	X11702
3CH	ID11503	Y11703	X11703
4CH	ID11504	Y11704	X11704
5CH	ID11505	Y11705	X11705
6CH	ID11506	Y11706	X11706
7CH	ID11507	Y11707	X11707

Note:

1. Forbid the unused channel to improve the I/O scanning speed.
2. If set off the enable bit of the channel, this channel will not accept the data. (the data display is 0).

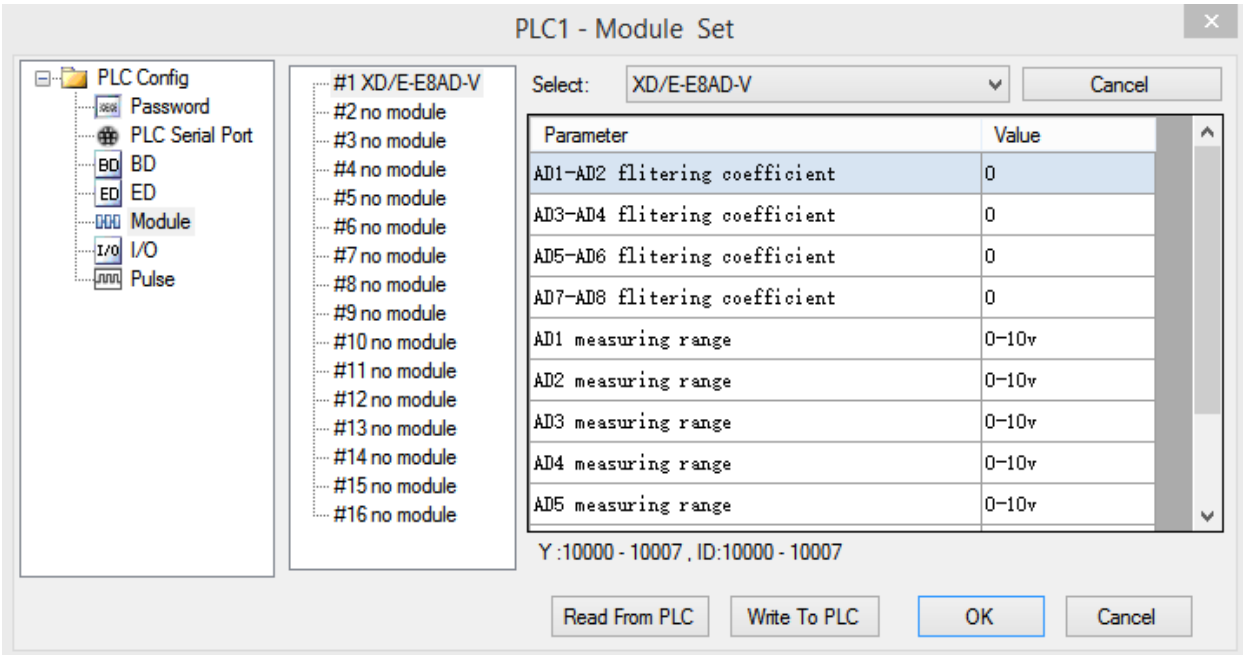
7-4. Working mode

There are two ways to set the working mode:

1. XDPpro software
2. Flash registers of PLC

XDPpro software:

Open the XDPpro software, click configure/expansion module settings:
Set the model and channel parameters in the following window. Then click write to PLC.
Please restart the PLC after setting.
Note:
1. The first-order low-pass filtering method uses this sampling value and the last filtering output value for weighting to get the effective filtering value.
2. The filter coefficient is set to 0 ~ 254 by the user, the smaller the value is, the more stable the data is, but it may cause data lag; when it is set to 1, the filtering effect is the strongest, and when it is set to 254, the filtering effect is the weakest, and the default value is 0 (no filtering).
3. When the module flag bit 
is set on, please monitor X but not Y, as Y is channel enable bit.
For example, AD channel 1 is voltage mode, AD detection is over range, X10000 will be ON.



Flash registers:
The module is voltage input mode, the voltage range include 0~10V, 0~5V, -10~10V, -5~5V. Set the modes through SFD registers of PLC. See the following table:

Module no.	SFD address	Module no.	SFD address
#1	SFD350~SFD359	#9	SFD430~SFD439
#2	SFD360~SFD369	#10	SFD440~SFD449
#3	SFD370~SFD379	#11	SFD450~SFD459

#4	SFD380~SFD389	#12	SFD460~SFD469
#5	SFD390~SFD399	#13	SFD470~SFD479
#6	SFD400~SFD409	#14	SFD480~SFD489
#7	SFD410~SFD419	#15	SFD490~SFD499
#8	SFD420~SFD429	#16	SFD500~SFD509

Note: each SFD register can set 4 channels mode. Each register has 16 bits, every 4 bits set one channel mode.

SFD bit definition:

<table>
<tr><th colspan="2" rowspan="2">Register</th><th>Bit7</th><th>Bit6</th><th>Bit5</th><th>Bit4</th><th>Bit3</th><th>Bit2</th><th>Bit1</th><th>Bit0</th><th rowspan="2">Note</th></tr>

</table>

		0000：0~10V 0001：0~5V 0010：-10~10V 0011：-5~5V	0000：0~10V 0001：0~5V 0010：-10~10V 0011：-5~5V	
SFD354	Byte8	AD channel short circuit/open circuit/over range detection switch		
	Byte9	-		
SFD355~SFD359		-		

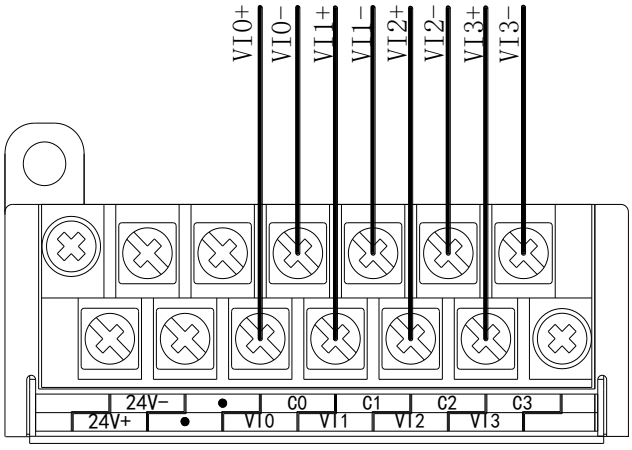
For example: set module no.1 channel 1 and channel 0 mode to 0~10V. Set channel 3 and channel 2 mode to 0~5V. Set channel 5 and channel 4 mode to -5~5V. Set channel 7 and channel 6 mode to -10~10V. The filter factor of channel 0 to channel 3 is 255. The filter factor of channel 4 to channel 7 is 100.
Then the SFD350=FFFFH SFD351=6464H SFD352=1100H SFD353=2233H

7-5. Exterior connection

Notes:

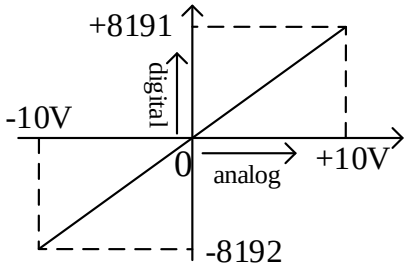
- When connect external＋24V power, please use the 24V power of PLC to avoid interference.
- To avoid interference, please use shield cable and single point ground for the shield layer.

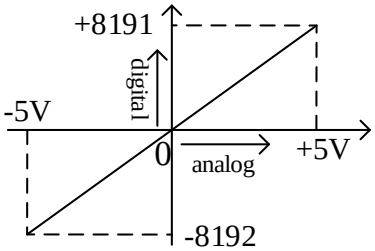
Voltage input:



7-6. AD conversion diagram

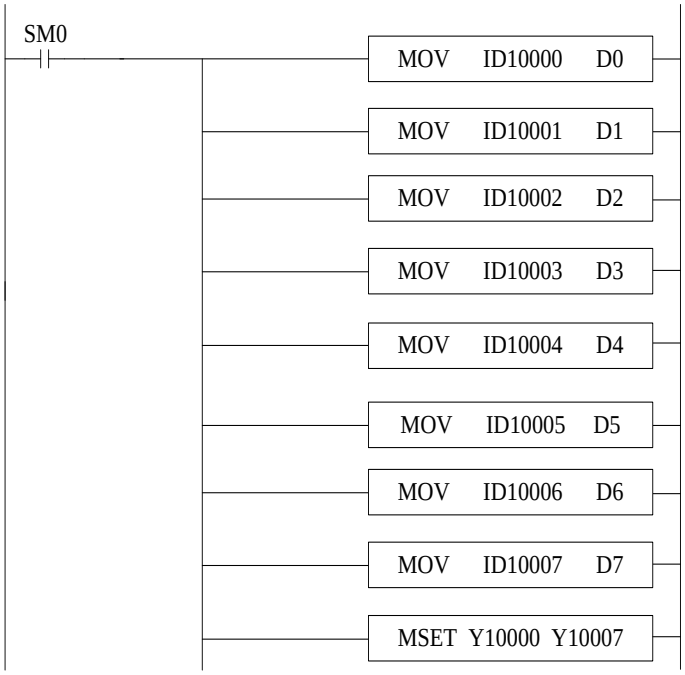
The relationship between analog value and digital value is shown as the following diagram:

0~10V voltage input	0~5V voltage input
	-10~10V voltage input	**-5~5V voltage input**
	




7-7. Program application

Real-time read the data of the 8 channels (module no.1)



Explanation:

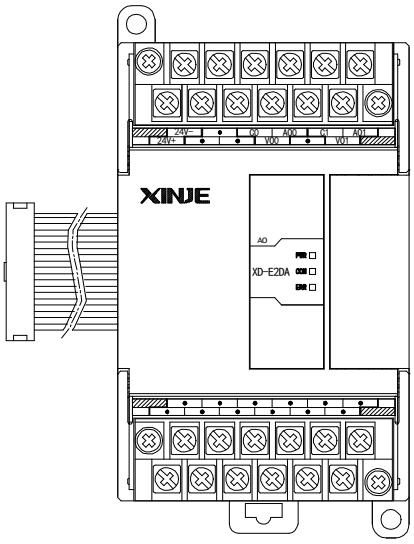
SM0 is always ON coil.

PLC is running. PLC keeps on writing channel 0 data to D0, channel 1 data to D1, channel 2 data to D2, channel 3 data to D3, channel 4 data to D4, channel 5 data to D5, channel 6 data to D6, channel 7 data to D7. Set ON all the channels enable bits.

8. Analog output module XD-E2DA

8-1. Specifications

XD-E2DA transforms 2 channels of 12 bits digital value to current or voltage output.



Features:

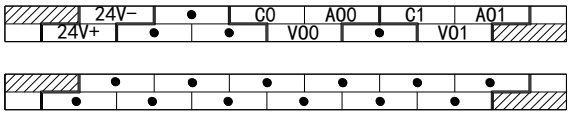
- 2-channel analog output.
- As a special function module of XD series, XD3 can connect up to 10 modules on the right side of PLC main unit, XD5/XDM/XDC/ XD5E/XDME can expand 16 modules, XD1/XD2 does not support expansion modules.

Specifications:

Items	Voltage output	Current output
Analog output	0~5V, 0~10V, -5~5V, -10~10V (external load resistor 2KΩ~1MΩ)	0~20mA, 4~20mA (external load resistor is less than 500Ω)
Digital input	12 bits binary value (0~4095 or -2048~2047)	
Resolution	1/4095(12 bit)	
General precision	±1%	
Conversion speed	2ms per channel	
Power supply for analog using	DC24V ±10%,150mA	
Installation	Fix with M3 screws or install on DIN46277 (width: 35mm) leader directly	
Dimension	63mm×108mm×89.9mm	

Note: XD-E2DA module below version V7 does not support -5 ~ 5V and -10 ~ 10V.

8-2. Terminals



Channel	Terminal name	Signal name
CH0	AO0	Current output
	VO0	Voltage output
	C0	CH0 common terminal
CH1	AO1	Current output
	VO1	Voltage output
	C1	CH1 common terminal
-	24V+	+24V power supply
	24V-	Common terminal of power supply

8-3. I/O address assignment

XD series analog modules don't occupy I/O units; the converted value is sent to PLC register directly. The PLC registers are shown as the following:

Note: each channel can only be used when the enable bit is turned on.

Expansion module no.1

Channel	DA signal	Channel enable bit (set on this bit to use this channel)
0CH	QD10000	Y10000
1CH	QD10001	Y10001

Expansion module no.2

Channel	DA signal	Channel enable bit (set on this bit to use this channel)
0CH	QD10100	Y10100
1CH	QD10101	Y10101

Expansion module no.3

Channel	DA signal	Channel enable bit (set on this bit to use this channel)
0CH	QD10200	Y10200
1CH	QD10201	Y10201

Expansion module no.4

Channel	DA signal	Channel enable bit (set on this bit to use this channel)
0CH	QD10300	Y10300
1CH	QD10301	Y10301

Expansion module no.5

Channel	DA signal	Channel enable bit (set on this bit to use this channel)
0CH	QD10400	Y10400
1CH	QD10401	Y10401

Expansion module no.6

Channel	DA signal	Channel enable bit (set on this bit to use this channel)
0CH	QD10500	Y10500
1CH	QD10501	Y10501

Expansion module no.7

Channel	DA signal	Channel enable bit (set on this bit to use this channel)
0CH	QD10600	Y10600
1CH	QD10601	Y10601

Expansion module no.8

Channel	DA signal	Channel enable bit (set on this bit to use this channel)
0CH	QD10700	Y10700
1CH	QD10701	Y10701

Expansion module no.9

Channel	DA signal	Channel enable bit (set on this bit to use this channel)
0CH	QD10800	Y11000
1CH	QD10801	Y11001

Expansion module no.10

Channel	DA signal	Channel enable bit (set on this bit to use this channel)
0CH	QD10900	Y11100
1CH	QD10901	Y11101

Expansion module no.11

Channel	DA signal	Channel enable bit (set on this bit to use this channel)
0CH	QD11000	Y11200
1CH	QD11001	Y11201

Expansion module no.12

Channel	DA signal	Channel enable bit (set on this bit to use this channel)
0CH	QD11100	Y11300
1CH	QD11101	Y11301

Expansion module no.13

Channel	DA signal	Channel enable bit (set on this bit to use this channel)
0CH	QD11200	Y11400
1CH	QD11201	Y11401

Expansion module no.14

Channel	DA signal	Channel enable bit (set on this bit to use this channel)
0CH	QD11300	Y11500
1CH	QD11301	Y11501

Expansion module no.15

Channel	DA signal	Channel enable bit (set on this bit to use this channel)
0CH	QD11400	Y11600
1CH	QD11401	Y11601

Expansion module no.16

Channel	DA signal	Channel enable bit (set on this bit to use this channel)
0CH	QD11500	Y11700
1CH	QD11501	Y11701

Note:

1. Forbid the unused channel to improve the I/O scanning speed.
2. If set off the enable bit of the output channel, this channel will keep the present value.

8-4. Working mode

There are two ways to set the working mode:

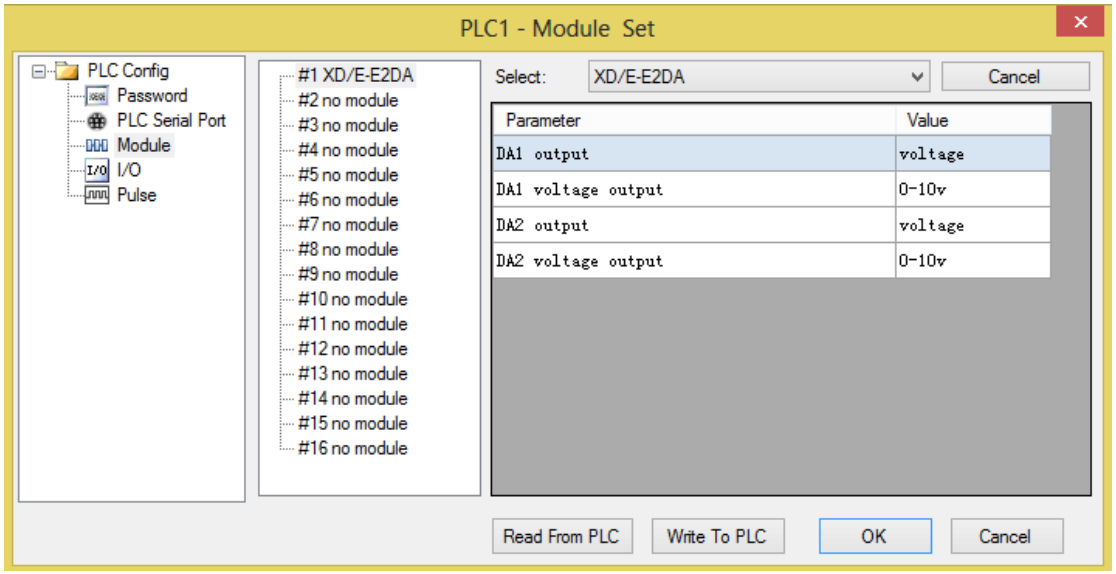
1. XDPpro software
2. Flash registers of PLC

XDPpro software:

Open the XDPpro software, click configure/expansion module settings:

Set the model and channel parameters in the following window. Then click write to PLC.

Please restart the PLC after setting.



Flash registers:

The module output has voltage 0 ~ 5V, 0 ~ 10V, -5~5V, -10~10V; current 0 ~ 20mA, 4 ~ 20mA, set the modes through the PLC FLASH registers SFD.

Module no.	SFD address	Module no.	SFD address
#1	SFD350~SFD359	#9	SFD430~SFD439
#2	SFD360~SFD369	#10	SFD440~SFD449
#3	SFD370~SFD379	#11	SFD450~SFD459
#4	SFD380~SFD389	#12	SFD460~SFD469
#5	SFD390~SFD399	#13	SFD470~SFD479
#6	SFD400~SFD409	#14	SFD480~SFD489
#7	SFD410~SFD419	#15	SFD490~SFD499
#8	SFD420~SFD429	#16	SFD500~SFD509

SFD bit definition:

Expansion module no.1:

<table>
<tr><th colspan="2">Register</th><th>Bit7</th><th>Bit6</th><th>Bit5</th><th>Bit4</th><th>Bit3</th><th>Bit2</th><th>Bit1</th><th>Bit0</th><th>Note</th></tr>
<tr><td rowspan="3">SFD350</td><td rowspan="2">Byte0</td><td colspan="4">DA2</td><td colspan="4">DA1</td><td rowspan="3">To define the DA output range. Byte0 low 4 bits are DA channel 1, high 4 bits are DA channel 2.</td></tr>
<tr><td>-</td><td colspan="3">000：0~10V
001：0~5V
100：-10~10V
101：-5~5V
010：0~20mA
011：4~20mA</td><td>-</td><td colspan="4">000：0~10V
001：0~5V
100：-10~10V
101：-5~5V
010：0~20mA
011：4~20mA</td></tr>
<tr><td>Byte1</td><td colspan="8">-</td></tr>
<tr><td colspan="2">SFD351~SFD359</td><td colspan="8">-</td></tr>
</table>

For example:

Set channel 1 and channel 0 working mode to 0~10V, 0~20mA.

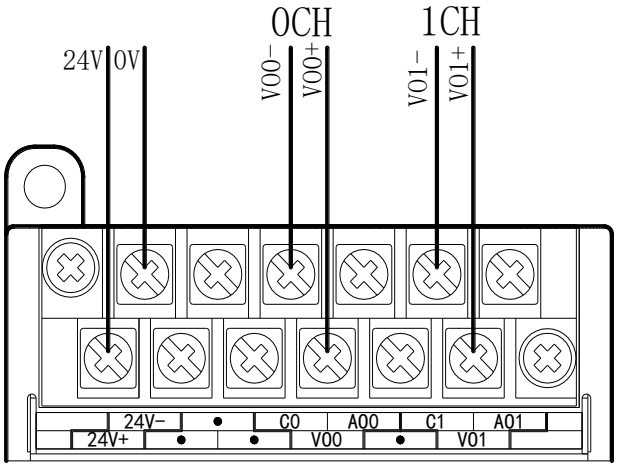
The SFD values are: SFD350=2H.

8-5. External connection

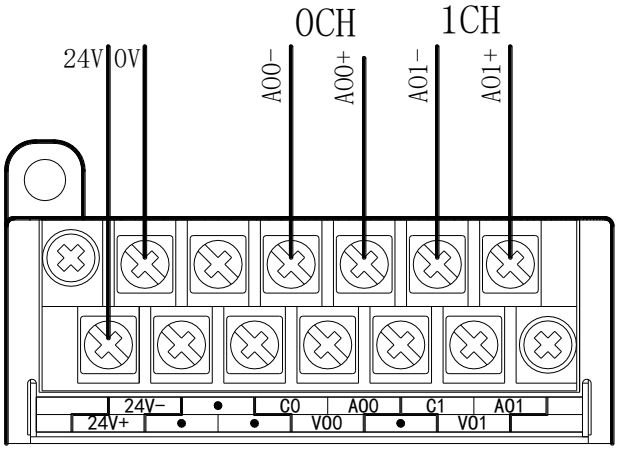
When make external connection, please note the following items:

- When connect to external +24V power supply, please use 24V power supply of PLC to avoid interference.
- To avoid interference, please use shield cable, and single-point ground with the shield layer.

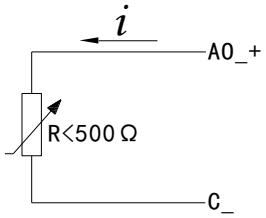
Voltage output:



Current output:



XD-E2DA current output wiring:



8-6. DA conversion diagram

The relationship between digital input value and analog output value is shown as below:

<table>
<tr><td>0~5V analog output</td><td>0~10V analog output</td></tr>
<tr><td> </td><td> </td></tr>
<tr><td>0~20mA analog output</td><td>4~20mA analog output</td></tr>
<tr><td> </td><td> </td></tr>
<tr><td>-5~5V analog output</td><td>-10~10V analog output</td></tr>
<tr><td> </td><td> </td></tr>
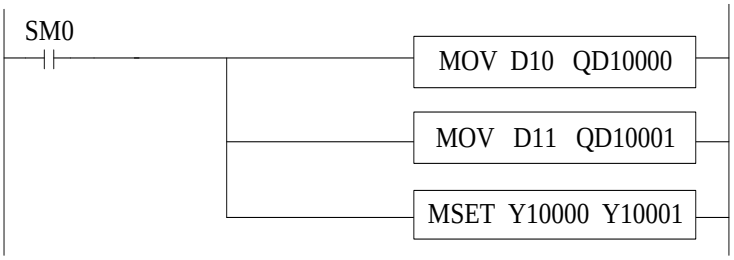
</table>

Note: when the input data exceeds K4095, the output analog data of D/A conversion remains unchanged at 5V, 10V or 20mA.

8-7. Programming

Real-time write data to 2 channels (take expansion module no.1 as an example)



Write the value of D10 to channel 0

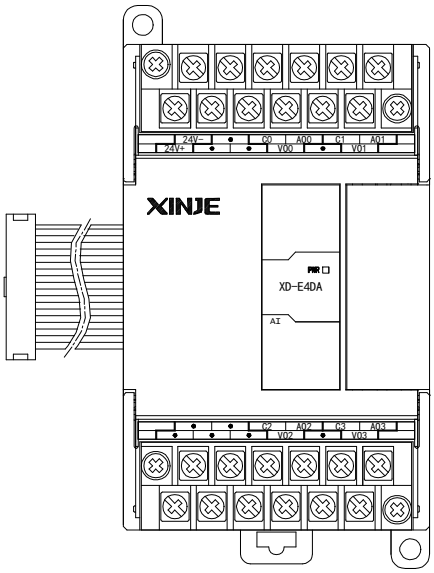
Write the value of D11 to channel 1

Set ON all the channel enable bits.

9. Analog output module XD-E4DA

9-1. Specifications

XD-E4DA module transforms 4 channels digital value to analog value and send the data to PLC.



Features:

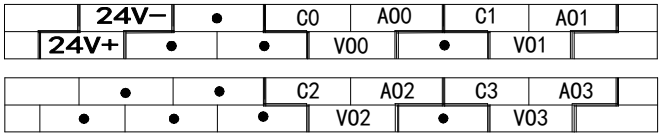
- 4-channel analog output: voltage output or current output.
- As a special function module of XD series, XD3 can connect up to 10 modules on the right side of PLC main unit, XD5/XDM/XDC/ XD5E/XDME can expand 16 modules, XD1/XD2 does not support expansion modules.

Specifications:

Items	Voltage output	Current output
Analog output	DC 0 to 5V, 0 to 10V (external load resistor 2KΩ~1MΩ)	DC 0 to 20mA, 4 to 20mA (external load resistor is less than 500Ω)
Digital input	12 bits binary value (0~4095)	
Resolution	1/4095(12 bit)	
General precision	1%	

Conversion speed	2ms per channel
Power supply for analog using	DC24V ±10%,150mA
Installation	Fix with M3 screws or install on DIN46277 (width: 35mm) leader directly
Dimension	63mm×108mm×89.9mm

9-2. Terminals



Channel	Terminal name	Signal name
CH0	AO0	Current output
	VO0	Voltage output
	C0	CH0 common terminal
CH1	AO1	Current output
	VO1	Voltage output
	C1	CH1 common terminal
CH2	AO2	Current output
	VO2	Voltage output
	C2	CH2 common terminal
CH3	AO3	Current output
	VO3	Voltage output
	C3	CH3 common terminal
-	24V+	+24V power supply
	24V-	Common terminal of power supply

9-3. I/O address assignment

XD series analog modules don't occupy I/O units; the converted value is sent to PLC register directly. The PLC registers are shown as the following:

Note: each channel can only be used when the enable bit is turned on.

Expansion module no.1

Channel	DA signal	Channel enable bit (set on this bit to use this channel)
0CH	QD10000	Y10000
1CH	QD10001	Y10001
2CH	QD10002	Y10002
3CH	QD10003	Y10003

Expansion module no.2

Channel	DA signal	Channel enable bit (set on this bit to use this channel)
0CH	QD10100	Y10100
1CH	QD10101	Y10101
2CH	QD10102	Y10102
3CH	QD10103	Y10103

Expansion module no.3

Channel	DA signal	Channel enable bit (set on this bit to use this channel)
0CH	QD10200	Y10200
1CH	QD10201	Y10201
2CH	QD10202	Y10202
3CH	QD10203	Y10203

Expansion module no.4

Channel	DA signal	Channel enable bit (set on this bit to use this channel)
0CH	QD10300	Y10300
1CH	QD10301	Y10301
2CH	QD10302	Y10302
3CH	QD10303	Y10303

Expansion module no.5

Channel	DA signal	Channel enable bit (set on this bit to use this channel)
0CH	QD10400	Y10400
1CH	QD10401	Y10401

2CH	QD10702	Y10702
3CH	QD10703	Y10703

Expansion module no.9

Channel	DA signal	Channel enable bit (set on this bit to use this channel)
0CH	QD10800	Y11000
1CH	QD10801	Y11001
2CH	QD10802	Y11002
3CH	QD10803	Y11003

Expansion module no.10

Channel	DA signal	Channel enable bit (set on this bit to use this channel)

0CH	QD10900	Y11100
1CH	QD10901	Y11101
2CH	QD10902	Y11102
3CH	QD10903	Y11103

Expansion module no.11

Channel	DA signal	Channel enable bit (set on this bit to use this channel)
0CH	QD11000	Y11200
1CH	QD11001	Y11201
2CH	QD11002	Y11202
3CH	QD11003	Y11203

Expansion module no.12

Channel	DA signal	Channel enable bit (set on this bit to use this channel)
0CH	QD11100	Y11300
1CH	QD11101	Y11301
2CH	QD11102	Y11302
3CH	QD11103	Y11303

Expansion module no.13

Channel	DA signal	Channel enable bit (set on this bit to use this channel)
0CH	QD11200	Y11400
1CH	QD11201	Y11401
2CH	QD11202	Y11402
3CH	QD11203	Y11403

Expansion module no.14

Channel	DA signal	Channel enable bit (set on this bit to use this channel)
0CH	QD11300	Y11500
1CH	QD11301	Y11501
2CH	QD11302	Y11502
3CH	QD11303	Y11503

Expansion module no.15

Channel	DA signal	Channel enable bit (set on this bit to use this channel)
0CH	QD11400	Y11600
1CH	QD11401	Y11601
2CH	QD11402	Y11602
3CH	QD11403	Y11603

Expansion module no.16

Channel	DA signal	Channel enable bit (set on this bit to use this channel)
0CH	QD11500	Y11700
1CH	QD11501	Y11701
2CH	QD11502	Y11702
3CH	QD11503	Y11703

Note:

1. Forbid the unused channel to improve the I/O scanning speed.
2. If set off the enable bit of the output channel, this channel will keep the present value.

9-4. Working mode

There are two ways to set the working mode:

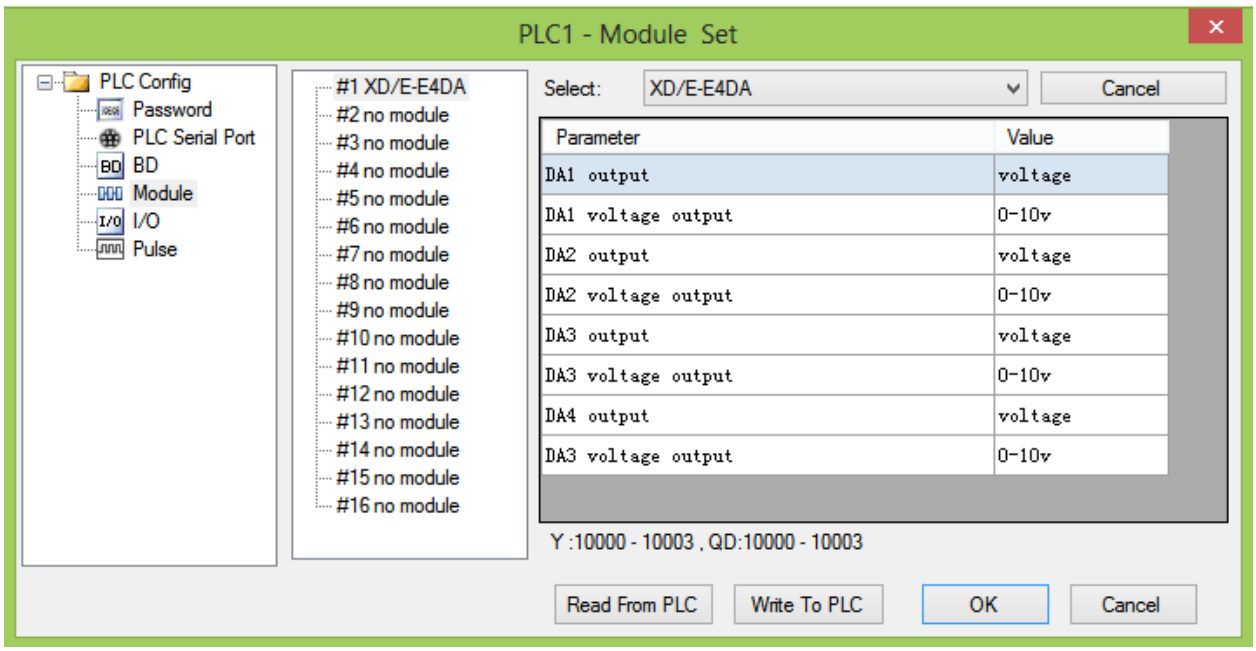
1. XDPpro software
2. Flash registers of PLC

XDPpro software:

Open the XDPpro software, click configure/expansion module settings:

Set the model and channel parameters in the following window. Then click write to PLC.

Please restart the PLC after setting.



Flash registers:

The module output has voltage 0 ~ 5V, 0 ~ 10V, current 0 ~ 20mA, 4 ~ 20mA, set the modes through the PLC FLASH registers SFD.

Module no.	SFD address	Module no.	SFD address
#1	SFD350~SFD359	#9	SFD430~SFD439
#2	SFD360~SFD369	#10	SFD440~SFD449
#3	SFD370~SFD379	#11	SFD450~SFD459
#4	SFD380~SFD389	#12	SFD460~SFD469
#5	SFD390~SFD399	#13	SFD470~SFD479
#6	SFD400~SFD409	#14	SFD480~SFD489
#7	SFD410~SFD419	#15	SFD490~SFD499
#8	SFD420~SFD429	#16	SFD500~SFD509

SFD bit definition:

Expansion module no.1:

	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	Explanation
	DA2				**DA1**				To define the DA output range. Byte0 low 4 bits are DA channel 1, high 4 bits are DA channel 2. Byte1 low 4 bits are DA channel 3, high 4 bits are DA channel 4.
Byte0	-	-	0: voltage output 1: current output	0：0~10V 1：0~5V 0：0~20mA 1：4~20mA	-	-	0: voltage output 1: current output	0:0~10V 1:0~5V 0:0~20mA 1:4~20mA	
	DA4					**DA3**			
Byte1	-	-	0: voltage output 1: current output	0：0~10V 1：0~5V 0：0~20mA 1：4~20mA	-	-	0: voltage output 1: current output	0:0~10V 1:0~5V 0:0~20mA 1:4~20mA	
Byte2 ~ Byte19	-								

For example:

Set channel 4, 3, 2, 1 working mode to 0~10V, 0~10V, 0~20mA, 0~20mA.

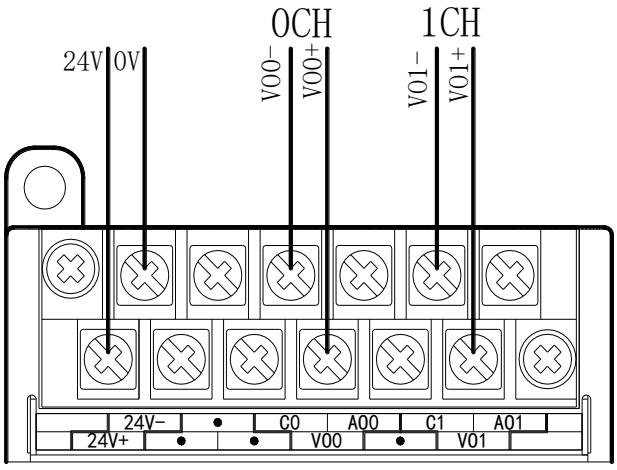
The SFD values are: SFD350=0022H.

9-5. External connection

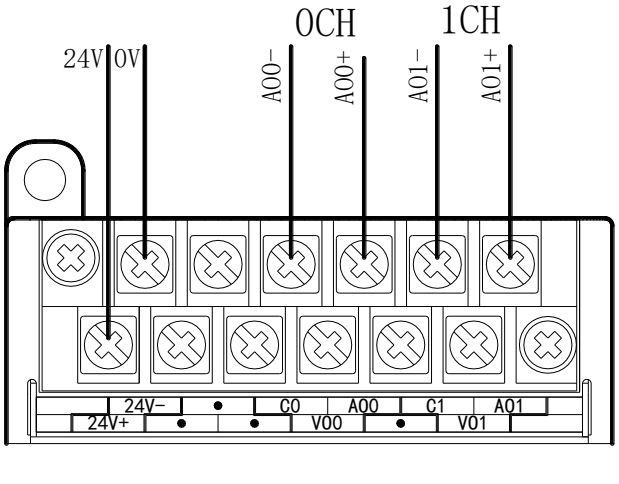
When make external connection, please note the following items:

- When connect to external +24V power supply, please use 24V power supply of PLC to avoid interference.
- To avoid interference, please use shield cable, and single-point ground with the shield layer.

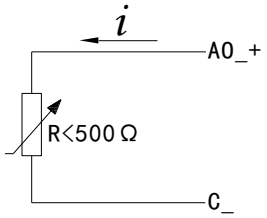
Voltage output:



Current output:



XD-E4DA current output wiring:



9-6. DA conversion diagram

The relationship between digital input value and analog output value is shown as below:

<table>
<tr><td>0~5V analog output</td><td>0~10V analog output</td></tr>
<tr><td> </td><td> </td></tr>
<tr><td>0~20mA analog output</td><td>4~20mA analog output</td></tr>
<tr><td> </td><td> </td></tr>
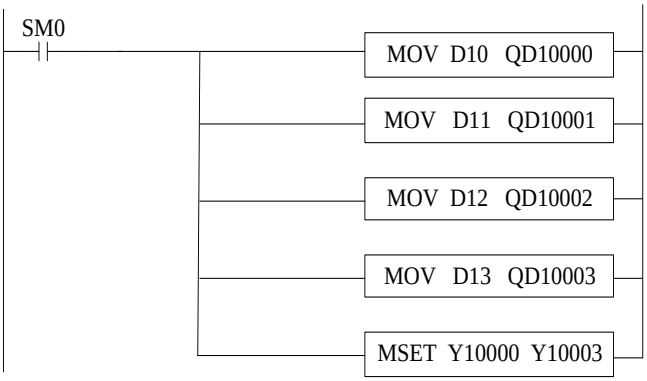
</table>

Note: when the input data exceeds K4095, the output analog data of D/A conversion remains unchanged at 5V, 10V or 20mA.

9-7. Programming

Real-time write data to 4 channels (take expansion module no.1 as an example)



Write the value of D10 to channel 0

Write the value of D11 to channel 1

Write the value of D12 to channel 2

Write the value of D13 to channel 3

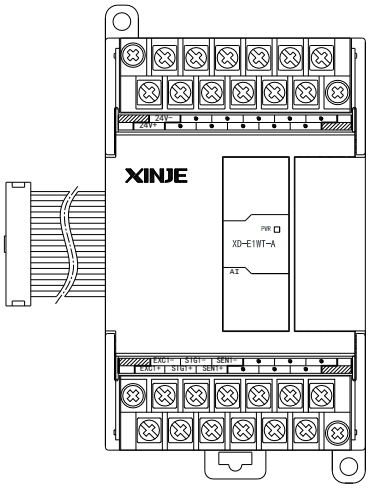
Set ON all the channel enable bits.

10. N channels pressure module XD-EnWT-A

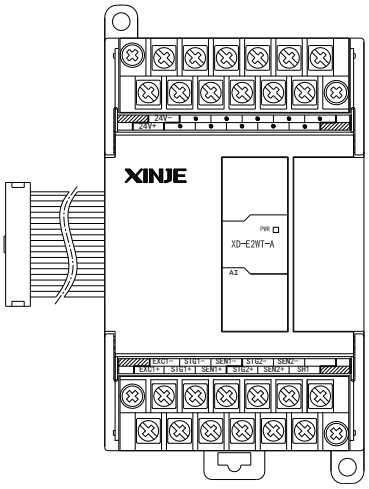
10-1. Features

This chapter mainly introduces XD-E1WT-A, XD-E2WT-A, XD-E4WT-A module specifications, terminal description, system composition, module functions and parameters, external connections, analog-to-digital conversion diagram and related programming examples.

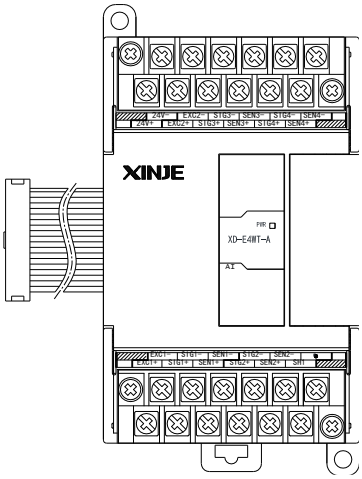
XD-E1WT-A



XD-E2WT-A



XD-E4WT-A



Features:

As an extension module of XD series PLC, n-channel pressure measurement module XD-EnWT-A can be used to detect voltage signal of -39.06mV~39.06mV or collect voltage signal of pressure sensor, and convert analog voltage value into digital value through A/D calculation.

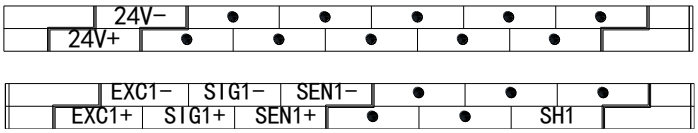
- The analog voltage signal of 1, 2 and 4 channels pressure sensor can be collected;
- It can detect the voltage signal of -39.06 mV ~ 39.06 mV;
- 24-bit high precision A/D conversion;
- As a special function module of XD series, XD3 can connect up to 10 modules on the right side of PLC main unit, XD5/XDM/XDC/ XD5E/XDME can expand 16 modules, XD1/XD2 does not support expansion modules.

Specifications:

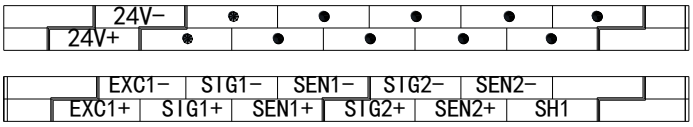
Input range	DC -39.06mV~39.06mV
Resolution	1/16777216 (24Bit)
Integrated precision	±0.1%
Transformation speed	0-250 times/second
Power supply	DC24V ±10%, 100mA
Sensor power supply	5VDC/120mA, can parallel 4 pieces of 350Ω pressure sensor
Installation	Mount on DIN46277 rail (width 35mm) or fix with screw M3
Working environment	No corrosive gas
Ambient temperature	0℃~60℃
Humidity	5~95%RH (no condensation)
Dimension	63mm×108mm×89.9mm
Software version	V3.2 and above

10-2. Terminals

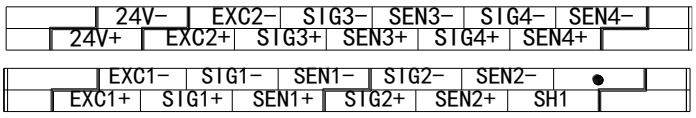
XD-E1WT-A:



XD-E2WT-A:



XD-E4WT-A:



XD-E1WT-A:

Channel	Terminal	Signal	Meaning
CH1	EXC1+	Excitation +	Connect to sensor power supply input
	EXC1-	Excitation -	
	SIG1+	Signal +	Connect to sensor signal output
	SIG1-	Signal -	
	SEN1+	Feedback +	Connect to sensor feedback voltage

	SEN1-	Feedback -	output
-	SH1	Shield	Connect to sensor ground terminal
	24V+	+24V power supply	Power supply of module
	24V-	Power supply common terminal	

XD-E2WT-A:

Channel	Terminal	Signal	Meaning
CH1	EXC1+	Excitation +	Connect to sensor power supply input
	EXC1-	Excitation -	
	SIG1+	Signal +	Connect to sensor signal output
	SIG1-	Signal -	
	SEN1+	Feedback +	Connect to sensor feedback voltage output
	SEN1-	Feedback -	
CH2	EXC2+	Excitation +	Connect to sensor power supply input
	EXC2-	Excitation -	
	SIG2+	Signal +	Connect to sensor signal output
	SIG2-	Signal -	
	SEN2+	Feedback +	Connect to sensor feedback voltage output
	SEN2-	Feedback -	
-	SH1	Shield	Connect to sensor ground terminal
	24V+	+24V power supply	Power supply of module
	24V-	Power supply common terminal	

XD-E4WT-A:

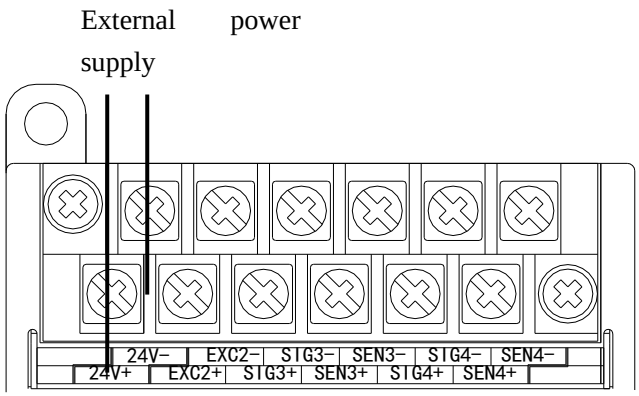
Channel	Terminal	Signal	Meaning
CH1	EXC1+	Excitation +	Connect to sensor power supply input
	EXC1-	Excitation -	
	SIG1+	Signal +	Connect to sensor signal output
	SIG1-	Signal -	
	SEN1+	Feedback +	Connect to sensor feedback voltage output
	SEN1-	Feedback -	
CH2	EXC2+	Excitation +	Connect to sensor power supply input
	EXC2-	Excitation -	
	SIG2+	Signal +	Connect to sensor signal output
	SIG2-	Signal -	
	SEN2+	Feedback +	Connect to sensor feedback voltage output
	SEN2-	Feedback -	
CH3	EXC3+	Excitation +	Connect to sensor power supply input
	EXC3-	Excitation -	

	SIG3+	Signal +	Connect to sensor signal output
	SIG3-	Signal -	
	SEN3+	Feedback +	Connect to sensor feedback voltage output
	SEN3-	Feedback -	
CH4	EXC4+	Excitation +	Connect to sensor power supply input
	EXC4-	Excitation -	
	SIG4+	Signal +	Connect to sensor signal output
	SIG4-	Signal -	
	SEN4+	Feedback +	Connect to sensor feedback voltage output
	SEN4-	Feedback -	
-	SH1	Shield	Connect to sensor ground terminal
	24V+	+24V power supply	Power supply of module
	24V-	Power supply common terminal	

10-3. External connection

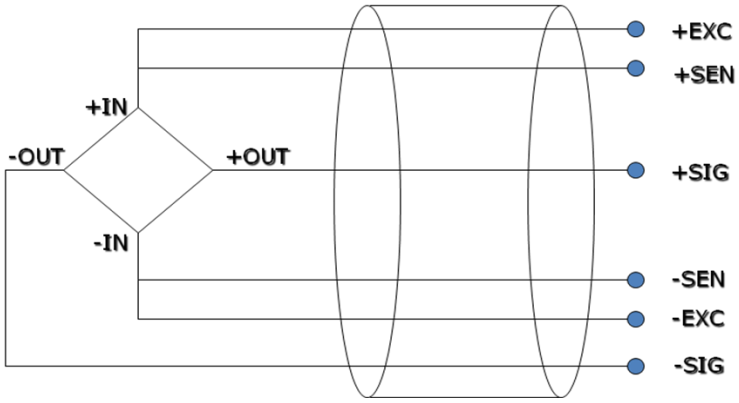
Please use the 24V power supply on the PLC to avoid interference.
Please use shield cable and single-point connect to the ground for shield layer.

Power supply wiring

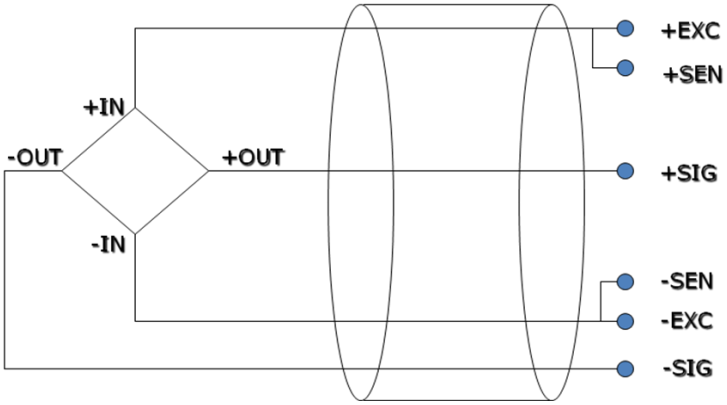


Connect to sensor

6 wires mode:



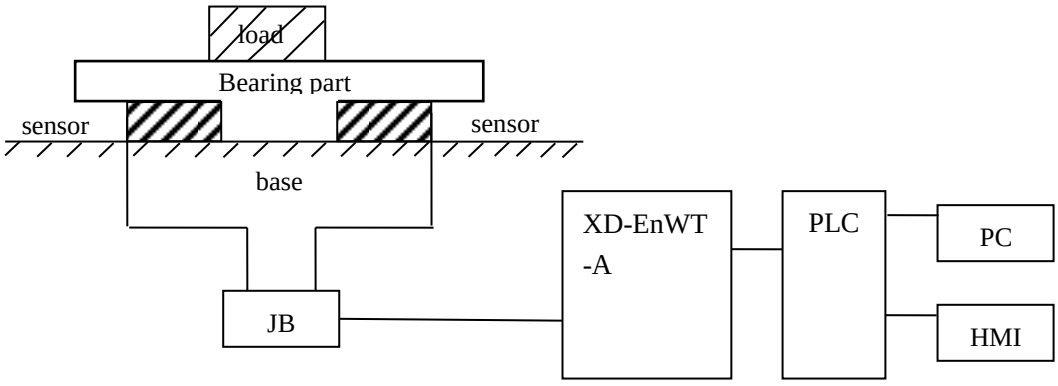
4 wires mode:



Note: short connect EXC- and SEN-, short connect EXC+ and SEN+ for 4 wires mode.

10-4. Weighing system

A typical weighing system:



Loading bearing part: to support the load. Such as flat, hopper, container, air transport car…
Pressure sensor: transform the weight to voltage signal.
Assembly part: make sure the pressure sensor can work correctly, assembly part and direct part can avoid overload. Overload will cause measurement error and sensor damage.
Connection box (JB): to collect several sensor signals.

XD-EnWT-A: can be used as an electronic assessment device, it gets the pressure sensor signal and makes further assessment.

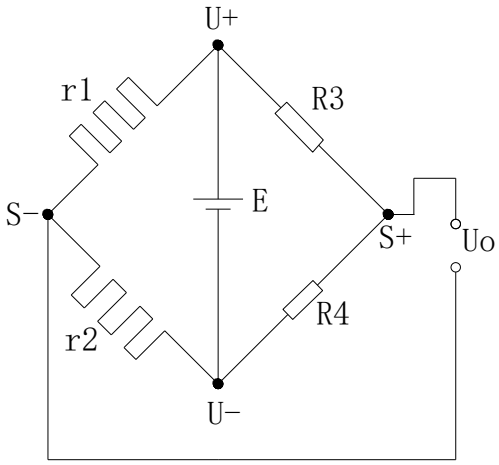
10-5. Module functions

XD-EnWT-A has the follow functions:

- Adjust the pressure sensor
- Collect the pressure sensor signal
- Calculate the weight value
- -39.06mV～39.06mV voltage signal detection

10-5-1. Pressure sensor

The pressure sensor is based on resistance strain effect, see the following diagram:



R1 and R2 is strain resistor which make bridge circuit with R3 and R4. With the change of R1 and R2, the bridge circuit will lose the balance, unbalance voltage Uo will be produced as the output of sensor.

U+ and U- are positive and negative point of the sensor power supply. Please select the 5V power of the module or from outside.

S+ and S- are positive and negative point of the sensor output. Connect the output to the module to test the weight.

10-6. I/O address

The I/O address of module 1:

Soft component		Address	Explanation	Mark
	CH1	Y10000	Fast sampling enable, ON is fast sampling, OFF is slow sampling	
		Y10001	Write in user-defined parameter	
		Y10002	Reset	

Output coil		Y10003	Calibration/resonance measurement	
	CH2	Y10004	Fast sampling enable, ON is fast sampling, OFF is slow sampling	
		Y10005	Write in user-defined parameter	
		Y10006	Reset	
		Y10007	Calibration/resonance measurement	
	CH3	Y10010	Fast sampling enable, ON is fast sampling, OFF is slow sampling	
		Y10011	Write in user-defined parameter	
		Y10012	Reset	
		Y10013	Calibration/resonance measurement	
	CH4	Y10014	Fast sampling enable, ON is fast sampling, OFF is slow sampling	
		Y10015	Write in user-defined parameter	
		Y10016	Reset	
		Y10017	Calibration/resonance measurement	
Input coil	CH1	X10000	CH1 resonance frequency measurement complete sign	
	CH2	X10001	CH2 resonance frequency measurement complete sign	
	CH3	X10002	CH3 resonance frequency measurement complete sign	
	CH4	X10003	CH4 resonance frequency measurement complete sign	
Input register	CH1	ID10000	Present digital value	Dword
		ID10002	Present weight	Dword
	CH2	ID10004	Present digital value	Dword
		ID10006	Present weight	Dword
	CH3	ID10008	Present digital value	Dword
		ID10010	Present weight	Dword
	CH4	ID10012	Present digital value	Dword
		ID10014	Present weight	Dword

The I/O address of module 2:

Soft component		Address	Explanation	Mark
Output coil	CH1	Y10100	Fast sampling enable, ON is fast sampling, OFF is slow sampling	
		Y10101	Write in user-defined parameter	
		Y10102	Reset	
		Y10103	Calibration/resonance measurement	
	CH2	Y10104	Fast sampling enable, ON is fast sampling, OFF is slow sampling	
		Y10105	Write in user-defined parameter	
		Y10106	Reset	
		Y10107	Calibration/resonance measurement	

	CH3	Y10110	Fast sampling enable, ON is fast sampling, OFF is slow sampling	
		Y10111	Write in user-defined parameter	
		Y10112	Reset	
		Y10113	Calibration/resonance measurement	
	CH4	Y10114	Fast sampling enable, ON is fast sampling, OFF is slow sampling	
		Y10115	Write in user-defined parameter	
		Y10116	Reset	
		Y10117	Calibration/resonance measurement	
Input coil	CH1	X10100	CH1 resonance frequency measurement complete sign	
	CH2	X10101	CH2 resonance frequency measurement complete sign	
	CH3	X10102	CH3 resonance frequency measurement complete sign	
	CH4	X10103	CH4 resonance frequency measurement complete sign	
Input register	CH1	ID10100	Present digital value	Dword
		ID10102	Present weight	Dword
	CH2	ID10104	Present digital value	Dword
		ID10106	Present weight	Dword
	CH3	ID10108	Present digital value	Dword
		ID10110	Present weight	Dword
	CH4	ID10112	Present digital value	Dword
		ID10114	Present weight	Dword

……..

The I/O address of module 16:

Soft component		Address	Explanation	Mark
Output coil	CH1	Y11700	Fast sampling enable, ON is fast sampling, OFF is slow sampling	
		Y11701	Write in user-defined parameter	
		Y11702	Reset	
		Y11703	Calibration/resonance measurement	
	CH2	Y11704	Fast sampling enable, ON is fast sampling, OFF is slow sampling	
		Y11705	Write in user-defined parameter	
		Y11706	Reset	
		Y11707	Calibration/resonance measurement	
	CH3	Y11710	Fast sampling enable, ON is fast sampling, OFF is slow sampling	
		Y11711	Write in user-defined parameter	
		Y11712	Reset	
		Y11713	Calibration/resonance measurement	

	CH4	Y11714	Fast sampling enable, ON is fast sampling, OFF is slow sampling	
		Y11715	Write in user-defined parameter	
		Y11716	Reset	
		Y11717	Calibration/resonance measurement	
Input coil	CH1	X11700	CH1 resonance frequency measurement complete sign	
	CH2	X11701	CH2 resonance frequency measurement complete sign	
	CH3	X11702	CH3 resonance frequency measurement complete sign	
	CH4	X11703	CH4 resonance frequency measurement complete sign	
Input register	CH1	ID11500	Present digital value	Dword
		ID11502	Present weight	Dword
	CH2	ID11504	Present digital value	Dword
		ID11506	Present weight	Dword
	CH3	ID11508	Present digital value	Dword
		ID11510	Present weight	Dword
	CH4	ID11512	Present digital value	Dword
		ID11514	Present weight	Dword

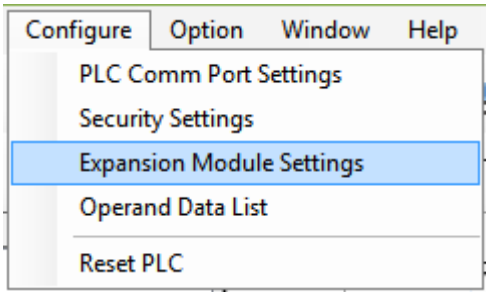
Note: XD-E1WT-A has no CH2~CH4; XD-E2WT-A has no CH3~CH4.

10-7. Working mode

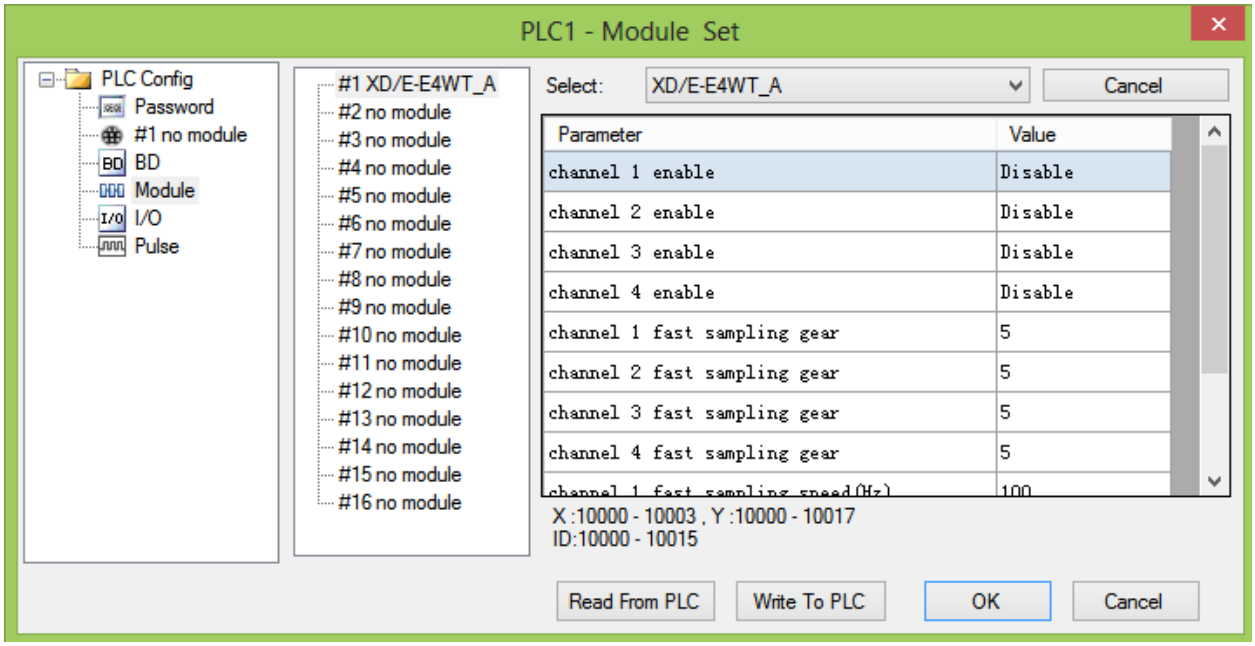
There are two methods to set the working mode:

1. set through the control panel
2. set through Flash register

Open the XD PLC software, click the menu configure/expansion module setting.



Choose the correct model and configuration information:



Flash register setting:

The expansion module can set the gear and user-defined fast sampling frequency through PLC flash register SFD.

Module no.	SFD address	Module no.	SFD address
#1	SFD350~SFD359	#9	SFD430~SFD439
#2	SFD360~SFD369	#10	SFD440~SFD449
#3	SFD370~SFD379	#11	SFD450~SFD459
#4	SFD380~SFD389	#12	SFD460~SFD469
#5	SFD390~SFD399	#13	SFD470~SFD479
#6	SFD400~SFD409	#14	SFD480~SFD489
#7	SFD410~SFD419	#15	SFD490~SFD499
#8	SFD420~SFD429	#16	SFD500~SFD509

SFD350~SFD359 register explanation:

<table>
<tr><th colspan="2">SFD</th><th>Bit7</th><th>Bit6</th><th>Bit5</th><th>Bit4</th><th>Bit3</th><th>Bit2</th><th>Bit1</th><th>Bit0</th><th>Explanation</th></tr>

<tr><td>Byte7</td><td colspan="8">-</td></tr>
<tr><td colspan="2">SFD354~359</td><td colspan="8">-</td></tr>
</table>

Note: XD-E1WT-A has no CH2~CH4; XD-E2WT-A has no CH3~CH4.

10-8. Module setting

Take module no.1 as an example:

Weight unit setting:

Write in weight through instruction TO. For example, the object weight is 1kg, write in 1 means the unit is kg, write in 1000 means the unit is g, write in 10000 means the unit is 0.1g.

Sampling frequency:

Sampling frequency includes fast sampling and slow sampling. The two states can be switched through Y10003. The default frequency of slow sampling is 5Hz. The fast sampling has 15 gears which can be selected in PLC expansion module configuration table. Each gear from 0 to 14 has different sampling frequency and filter parameters. User can choose suitable gear as actual needs, please refer to default gear parameter table. Gear 15 is user-defined mode, it can set the sampling frequency and filter parameter by user. User can set the fast sampling frequency (this parameter is invalid for other gears) by software and set the filter parameter by instruction FROM and TO.

Resonance frequency measurement:

1. resonance frequency is the fixed vibration interference generated by machine, it will be tested when installing the machine at the beginning.
2. repower on the module or write in 0 for the weight by instruction FROM and TO.
3. switch to fast sampling mode (Y10000 is ON), set on Y10003. The module will enter resonance frequency measurement. Then set OFF Y10003. X10000 will be ON when the measurement completed. The result will be automatic saved in the module. (it is necessary to test the resonance frequency in fast sampling mode)

Calibration:

Please calibrate the pressure sensor for the first time using.

Take module channel 1 as an example:

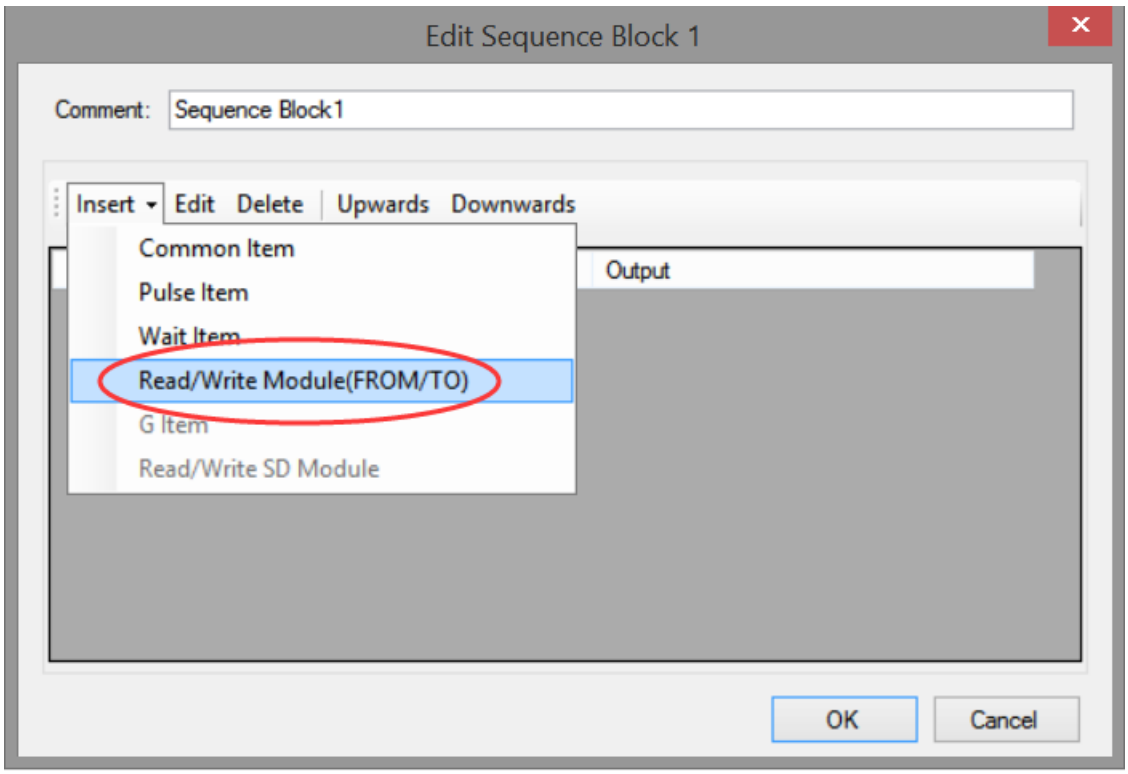
1. make sure the module connected to the weighting system. Please check if the value in ID10000 fluctuated (the fluctuation range is related to sensor range), the pressure value is increasing as the load increasing. If ID10000 has no value, please check the sensor wiring. If the pressure value is decreasing as the load increasing, the sensor positive and negative point may connect backward.
2. close fast sampling enable bit Y10000 before calibration.
3. make the pressure sensor without load, set to zero after the scale is stable, set ON Y10002(set to zero enable bit).
4. put the load on the scale, write in the load weight by instruction TO, calibrate the system after the scale is stable, set ON Y10003(calibration enable bit). The calibration completed when ID10002 is same to the load weight, set OFF Y10003.
5. Hereto, the calibration finished. The module will automatic adjust the result according to the idle load value and calibration value when weighing, and finally get the correct weight.

Default gear parameter:

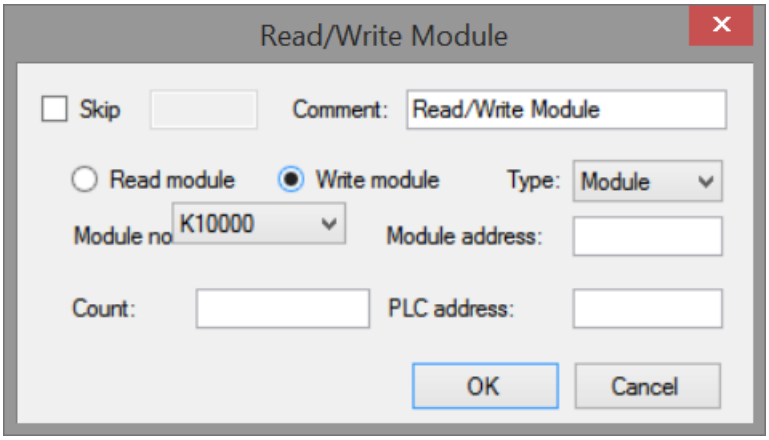
Speed gear	Fast sampling speed (Hz)	Fast sampling filter width	Kalman filter depth	IIR bandwidth coefficient	IIR attenuation ratio coeffcicent	Lowpass cut-off frequency
0	60	5	30	10	10	10
1	80	5	40	10	10	10
2	100	10	50	10	10	10
3	120	10	60	10	10	10
4	140	15	70	10	10	15
5	160	15	80	10	10	15
6	180	20	90	10	10	15
7	200	20	100	10	10	15
8	220	25	110	10	10	15
9	240	25	120	10	10	15
10	250	25	125	10	10	15
11	250	25	125	10	10	15
12	250	25	125	10	10	15
13	250	25	125	10	10	15
14	255	25	125	10	10	15

10-9. Instruction FROM and TO

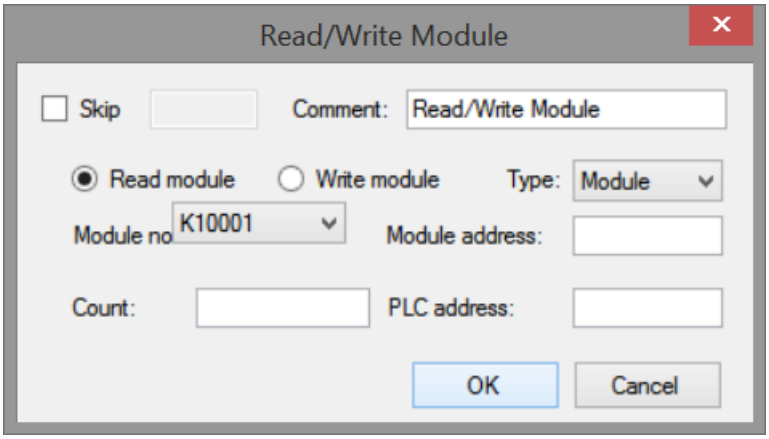
The reading and writing of XD-EnWT-A module needs to be completed through the FROM/TO instruction in the sequential function block, as shown in the figure below:



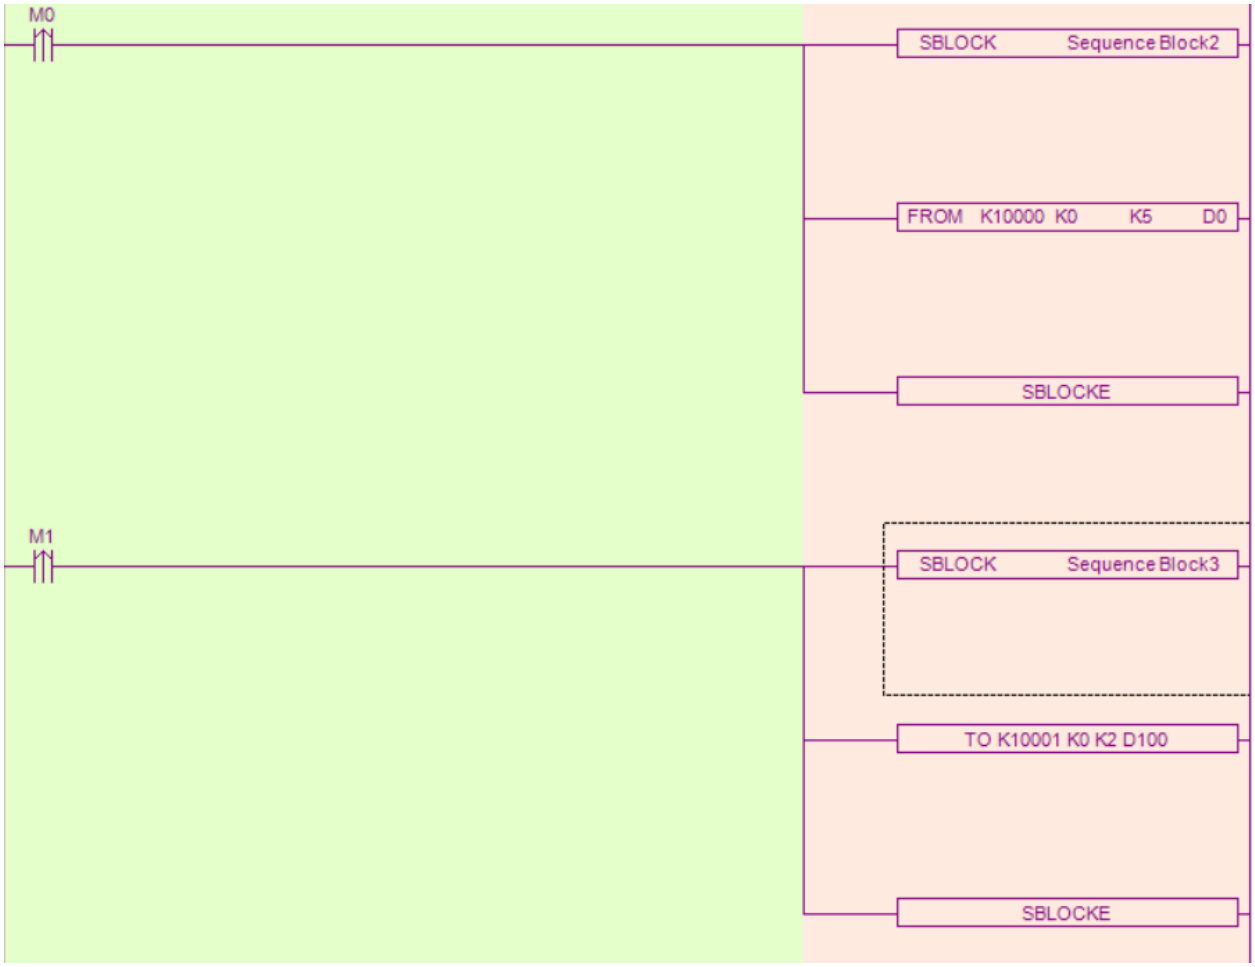
(a) Insert FROM/TO module



(b) Write instruction



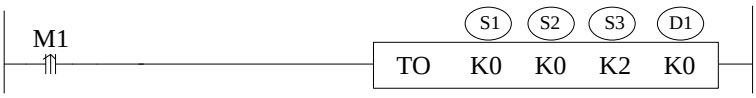
(c) Read instruction



(d) Ladder chart

Instructions:

- Write instruction TO



Function: write the PLC register data to module specified address, the unit is word.

Operand:

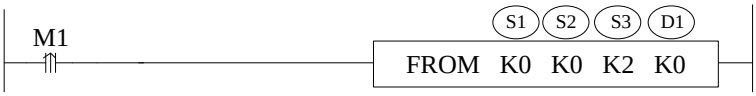
S1: target module number. Operand: K, TD, CD, D, FD.

S2: module first address. Operand: K, TD, CD, D, FD.

S3: write in register quantity. Operand: K, TD, CD, D, FD.

D1: write in data first address in PLC.

- Read instruction FROM



Function: read the module data to PLC register, the unit is word.
Operand:
S1: target module number. Operand: K, TD, CD, D, FD.
S2: module first address. Operand: K, TD, CD, D, FD.
S3: read register quantity. operand: K, TD, CD, D, FD.
D1: PLC register first address.

Note:

1. From/TO instruction can only be written in sequence function block, XD series PLC with firmware version less than v3.4.5 only allows up to 8 function blocks; XD/XL series PLC with firmware version v3.4.5 and above can write up to 100 blocks in the program, but can only run up to 8 blocks at the same time.
2. The starting number of module starts from k10000, k10000 is module 1 and k10001 is module 2. By analogy, module 16 is K10015.

Module parameter internal address:

From/ToData		
K0	CH1 calibration weight	Dword
K2	CH1 fast sampling filter width	Word
K3	CH1 filter depth	Word
K4	CH1 bandwidth coefficient	Word
K5	CH1 attenuation coefficient	Word
K6	CH1 low pass cutoff frequency	Word
K7	CH1 resonance frequency (0.1HZ)	Word
K8	CH2 calibration weight	Dword
K10	CH2 fast sampling filter width	Word
K11	CH2 filter depth	Word
K12	CH2 bandwidth coefficient	Word
K13	CH2 attenuation coefficient	Word
K14	CH2 low pass cutoff frequency	Word
K15	CH2 resonance frequency (0.1HZ)	Word
K16	CH3 calibration weight	Dword
K18	CH3 fast sampling filter width	Word
K19	CH3 filter depth	Word
K20	CH3 bandwidth coefficient	Word
K21	CH3 attenuation coefficient	Word
K22	CH3 low pass cutoff frequency	Word
K23	CH3 resonance frequency (0.1HZ)	Word

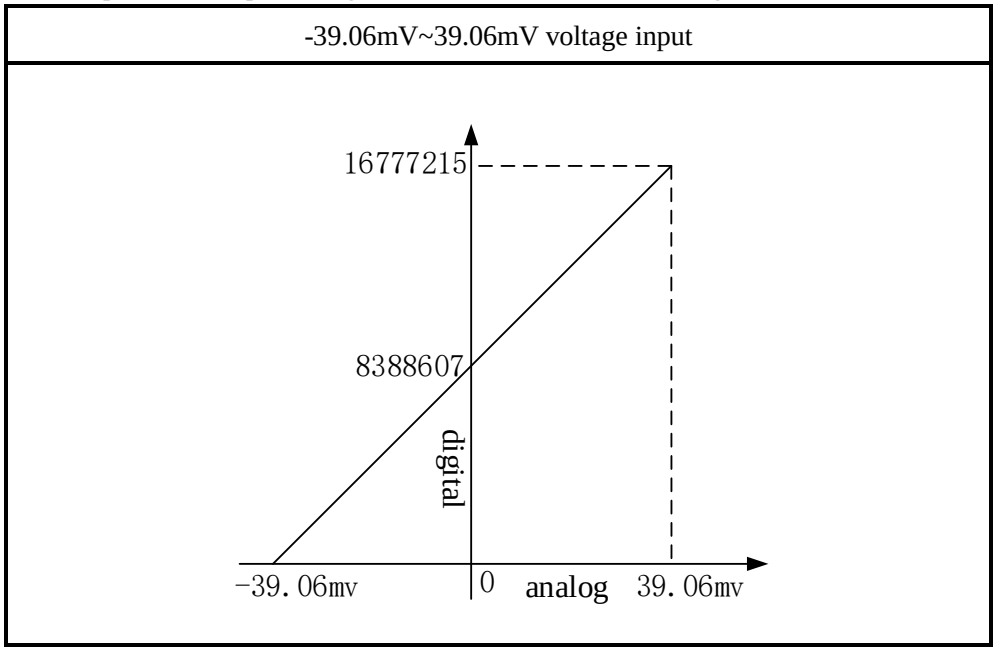
K24	CH4 calibration weight	Dword
K26	CH4 fast sampling filter width	Word
K27	CH4 filter depth	Word
K28	CH4 bandwidth coefficient	Word
K29	CH4 attenuation coefficient	Word
K30	CH4 low pass cutoff frequency	Word
K31	CH4 resonance frequency (0.1HZ)	Word

Parameter explanation:

1. calibration weight: write in weight when calibrating
2. fast sampling filter width: the average times of fast sampling filter
3. attenuation coefficient: the larger the more stable, but too large will make the sampling value distortion and sensitivity reduction.
4. bandwidth coefficient: the larger the more stable, but too large will make the sampling value distortion and sensitivity reduction.
5. resonance frequency: the scale has natural frequency; this frequency can be known by internal measurement. The more accurate of the frequency, the better the filtering effect.
6. Filter depth: the larger the data, more stable the system, the lower the sensitivity.

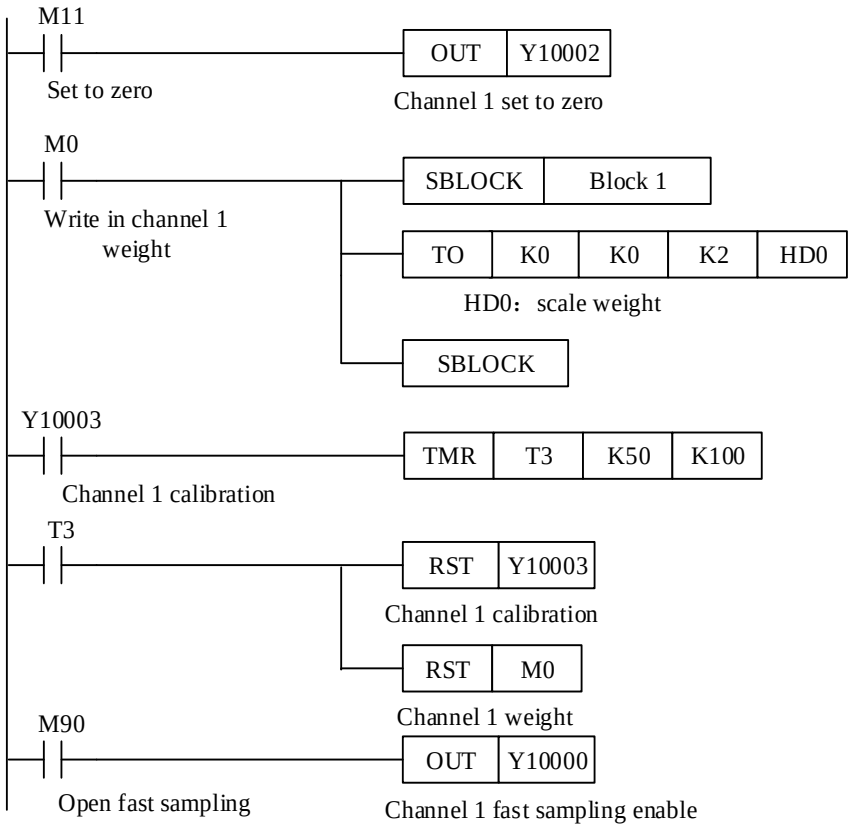
10-10. A/D transformation diagram

The relationship between input voltage value and A/D transformed digital value:



10-11. Application program

Take module 1 as an example:



Explanation:

Set to zero through Y10002.

Write in the weight value through instruction TO. First send the weight value in HD0, set ON M0, write the value of HD0 to module 1 channel 1.

Put the load, calibrate the scale through Y10003. The calibration is finished when the weight value is equal to the weight display value.

Switch the slow or fast sampling through Y10000.

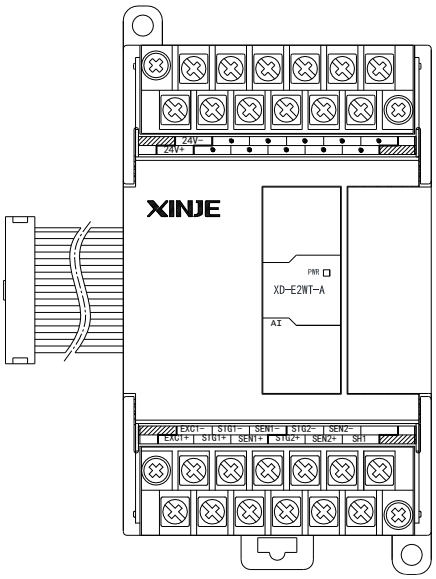
Y10000 open, channel 1 will collect data with fast sampling frequency.

Y10000 close, channel 1 will collect data with slow sampling frequency.

11. 2 channels pressure module XD-E2WT-B

11-1. Features

XD-E2WT-B is the expansion module of XD series PLC. It can test the voltage in the range of 0mV~10mV or the voltage signal from pressure sensor. Then it can transform the voltage to digital value through A/D transformation and do calculation.



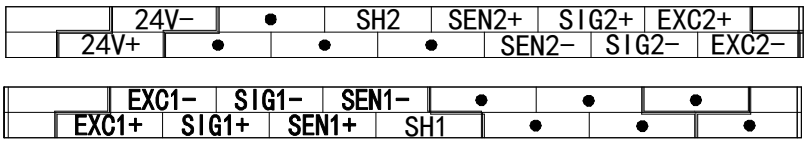
Features:

- 2 channels pressure sensor voltage signal input
- Test voltage signal in the range of 0~10mV
- 24-bit A/D transformation
- XD3 series PLC can connect 10 XD-E2WT-B modules
- XD5/XDM/XDC/XD5E/XDME series PLC can connect 16 XD-E2WT-B modules
- XD1, XD2 cannot extend modules

Specifications:

Input range	DC 0~10mV
Resolution	1/16777216 (24Bit)
Integrated precision	>0.01%
Transformation speed	10-200 times/second
Power supply	DC24V ±10%, 100mA
Sensor power supply	5VDC/120mA, can parallel 4 pieces of 350Ω pressure sensor
Installation	Mount on DIN46277 rail (width 35mm) or fix with screw M3
Dimension	63mm×108mm×89.9mm
Working environment	No corrosive gas
Ambient temperature	-10℃~50℃
Humidity	5~95%
Software version	V3.4 and higher version

11-2. Terminals



Channel	Terminal	Signal	Meaning
CH1	EXC1+	Excitation+	Connect to sensor power supply input
	EXC1-	Excitation-	
	SIG1+	Signal +	Connect to sensor signal output
	SIG1-	Signal -	
	SEN1+	Feedback +	Connect to sensor feedback voltage output
	SEN1-	Feedback -	
	SH1	Shield	Connect to sensor ground
CH2	EXC2+	Excitation+	Connect to sensor power supply input
	EXC2-	Excitation-	
	SIG2+	Signal +	Connect to sensor signal output
	SIG2-	Signal -	
	SEN2+	Feedback +	Connect to sensor feedback voltage

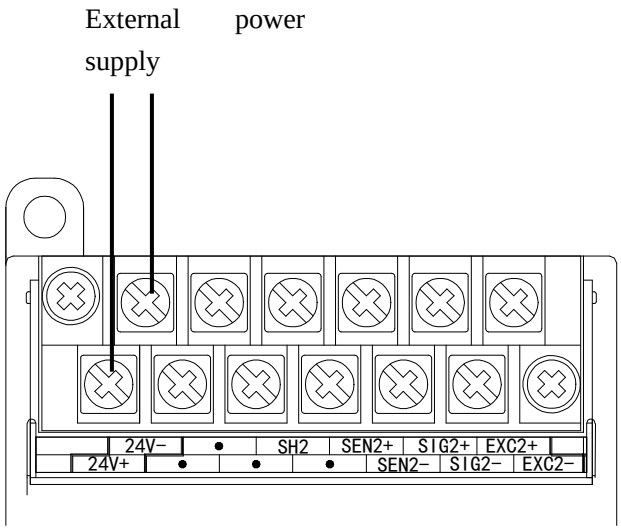
	SEN2-	Feedback -	output
	SH2	Shield	Connect to sensor ground
	24V+	+24V power supply	Module power supply
	24V-	Common terminal	

11-3. External connection

For external connection, please note the following cases:

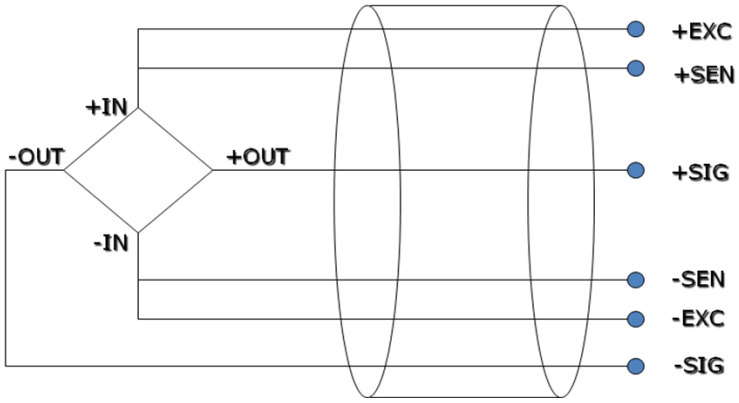
- Please use the 24V power supply on the PLC to avoid interference.
- Please use shield cable and single-point connect to the ground.

Power supply wiring

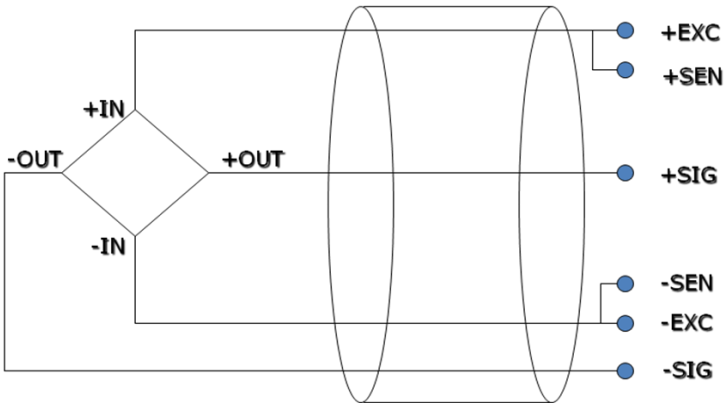


Connect to sensor

6 wires sensor:



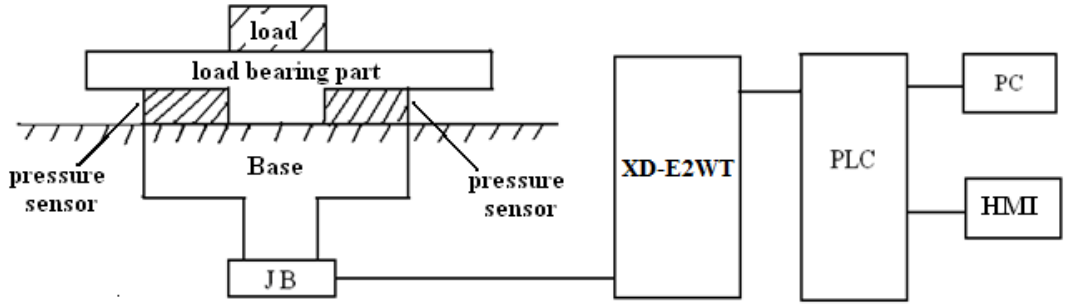
4 wires sensor:



Notes: if the sensor is 4 wires mode, please connect EXC1- and SEN1-, EXC1+ and SEN1+.

11-4. Weighing system

A typical weighing system:



Loading bearing part: to support the load. Such as flat, hopper, container, air transport car…
Pressure sensor: transform the weight to voltage signal.
Assembly part: make sure the pressure sensor can work correctly, assembly part and direct part can avoid overload. Overload will cause measurement error and sensor damage.
Connection box (JB): to collect several sensor signals.
XD-E2WT-B: can be used as an electronic assessment device, it gets the pressure sensor signal and makes

further assessment.

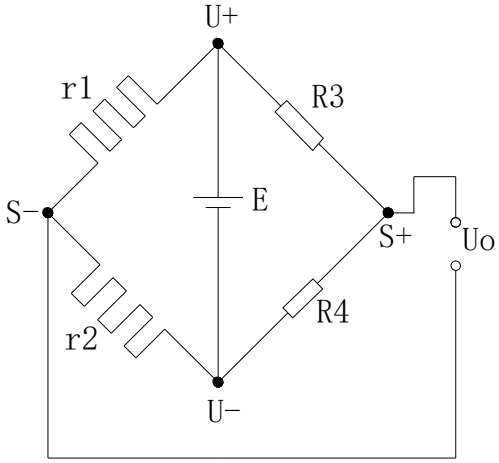
11-5. Module functions

XD-E2WT-B has the follow functions:

- Adjust the pressure sensor
- Collect the pressure sensor signal
- Calculate the weight value
- 0~10mV voltage signal test

11-5-1. Pressure sensor

The pressure sensor is based on resistance strain effect, see the following diagram:



R1 and R2 is strain resistor which make bridge circuit with R3 and R4. With the change of R1 and R2, the bridge circuit will lose the balance, unbalance voltage Uo will be produced as the output of sensor.

U+ and U- are positive and negative point of the sensor power supply. Please select the 5V power of the module or from outside.

S+ and S- are positive and negative point of the sensor output. Connect the output to the module to test the weight.

11-6. I/O address

Expansion module no.1 register address

Soft component		Address	Explanation	Note
Output coil	CH1	Y10000	resonance measurement	
		Y10001	write in user-defined parameters	
		Y10002	Reset	
		Y10003	Calibration	
	CH2	Y10004	resonance measurement	

		Y10005	write in user-defined parameters	
		Y10006	Reset	
		Y10007	Calibration	
Input coil	CH1	X10000	CH1 error	
	CH1	X10001	CH1 trapped wave enable	
	CH2	X10002	CH2 error	
	CH2	X10003	CH2 trapped wave enable	
Input register	CH1	ID10000	Present digital value /CH1 resonance frequency	Dword
		ID10002	Present weight	Dword
	CH2	ID10004	Present digital value / CH2 resonance frequency	Dword
		ID10006	Present weight	Dword

Expansion module no.2 register address

Soft component		Address	Explanation	Note
Output coil	CH1	Y10100	resonance measurement	
		Y10101	write in user-defined parameters	
		Y10102	Reset	
		Y10103	Calibration	
	CH2	Y10104	resonance measurement	
		Y10105	write in user-defined parameters	
		Y10106	Reset	
		Y10107	Calibration	
Input coil	CH1	X10100	CH1 error	
	CH1	X10101	CH1 trapped wave enable	
	CH2	X10102	CH2 error	
	CH2	X10103	CH2 trapped wave enable	
Input register	CH1	ID10100	Present digital value /CH1 resonance frequency	Dword
		ID10102	Present weight	Dword
	CH2	ID10104	Present digital value / CH2 resonance frequency	Dword
		ID10106	Present weight	Dword

……..

Expansion module no.16 register address

Soft component		Address	Explanation	Note
Output coil	CH1	Y11700	resonance measurement	
		Y11701	write in user-defined parameters	
		Y11702	Reset	
		Y11703	Calibration	
	CH2	Y11704	resonance measurement	

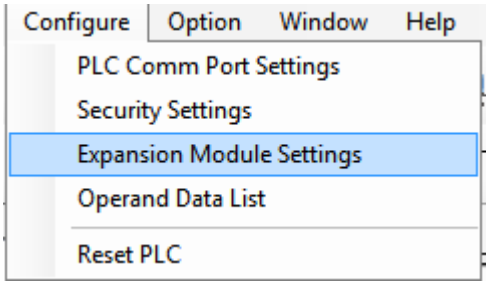
		Y11705	write in user-defined parameters	
		Y11706	Reset	
		Y11707	Calibration	
Input coil	CH1	X11700	CH1 error	
	CH1	X11701	CH1 trapped wave enable	
	CH2	X11702	CH2 error	
	CH2	X11703	CH2 trapped wave enable	
Input register	CH1	ID11500	Present digital value /CH1 resonance frequency	Dword
		ID11502	Present weight	Dword
	CH2	ID11504	Present digital value / CH2 resonance frequency	Dword
		ID11506	Present weight	Dword

11-7. Working mode

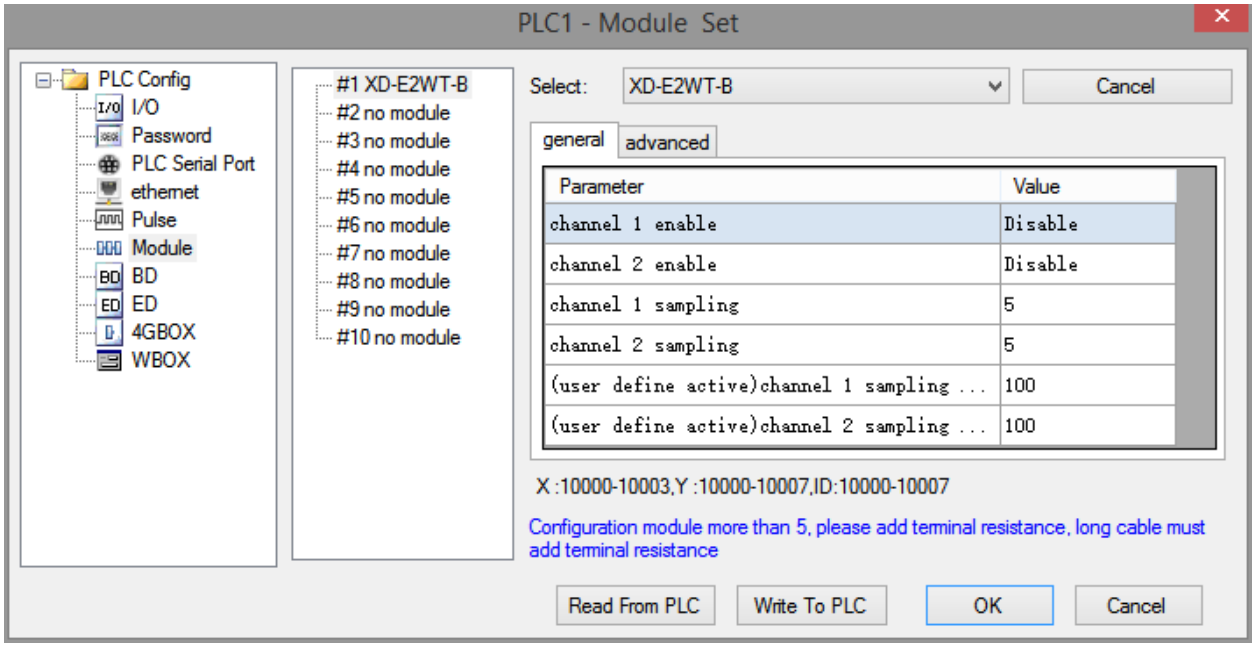
There are two modes to set the working mode:

1. set through the control panel
2. set through the Flash register

Open the PLC software, click configure/expansion module settings:



Choose suitable model information:



Flash register setting:

The expansion module can set gear and user-defined fast sampling frequency through the PLC internal flash register SFD.

Module no.	SFD address	Module no.	SFD address
#1	SFD350~SFD359	#9	SFD430~SFD439
#2	SFD360~SFD369	#10	SFD440~SFD449
#3	SFD370~SFD379	#11	SFD450~SFD459
#4	SFD380~SFD389	#12	SFD460~SFD469
#5	SFD390~SFD399	#13	SFD470~SFD479
#6	SFD400~SFD409	#14	SFD480~SFD489
#7	SFD410~SFD419	#15	SFD490~SFD499
#8	SFD420~SFD429	#16	SFD500~SFD509

SFD350~SFD359 register explanation:

<table>
<tr><th colspan="2">SFD</th><th>Bit7</th><th>Bit6</th><th>Bit5</th><th>Bit4</th><th>Bit3</th><th>Bit2</th><th>Bit1</th><th>Bit0</th><th></th></tr>
<tr><td rowspan="2">SFD350</td><td>Byte0</td><td></td><td></td><td>CH2 enable</td><td>CH1 enable</td><td></td><td></td><td></td><td></td><td rowspan="6"></td></tr>
<tr><td>Byte1</td><td colspan="4">CH2 fast sampling gear (0-12)</td><td colspan="4">CH1 fast sampling gear (0-12)</td></tr>
<tr><td rowspan="2">SFD351</td><td>Byte2</td><td colspan="4"></td><td colspan="4"></td></tr>
<tr><td>Byte3</td><td colspan="8">CH1 user-defined fast sampling speed (Hz) (10-200)</td></tr>
<tr><td rowspan="2">SFD352</td><td>Byte4</td><td colspan="8">CH2 user-defined fast sampling speed (Hz) (10-200)</td></tr>
<tr><td>Byte5</td><td colspan="8">-</td></tr>
</table>

11-8. Module setting

Take module no.1 channel 1 as an example:

Module parameter setting:

When the PLC sampling gear is set to 12, PLC will write in the parameters through the TO instruction. Other

gears are fixed parameters, cannot be changed.

The parameter list:

FromToData	Explanation	
K0	CH1 calibration weight	Dword
K2	CH1 mean filtering width (0-50)	Word
K3	CH1 median filtering width	Word
K4	CH1 Kalman filtering depth (0-200)	Word
K5	CH1 first order filter gear (0-6)	Word
K6	CH1 filter attenuation multiple（0-40）	Word
K7	CH1 user error code	Word
K8	CH2 calibration weight	Dword
K10	CH2 mean filtering width (0-50)	Word
K11	CH2 median filtering width	Word
K12	CH2 Kalman filtering depth (0-200)	Word
K13	CH2 first order filter gear (0-6)	Word
K14	CH2 filter attenuation multiples	Word
K15	CH2 user error code	Word

Default gear list:

Speed gear	Mean filtering width	Median filtering width	Kalman filtering depth	First order lag gear	Trapped wave attenuation multiples
0	3	0	0	1	0
1	3	3	0	1	0
2	5	5	40	2	2
3	8	7	0	2	20
4	10	9	0	2	30
5	12	10	0	3	40
6	15	12	20	3	40
7	20	15	20	3	40
8	12	10	20	2	30
9	15	10	20	3	30
10	15	12	20	4	30
11	15	15	40	4	40

Weight unit setting:

Write in weight through instruction TO. For example, the object weight is 1kg, write in 1 means the unit is kg, write in 1000 means the unit is g, write in 10000 means the unit is 0.1g.

Resonance frequency measurement:

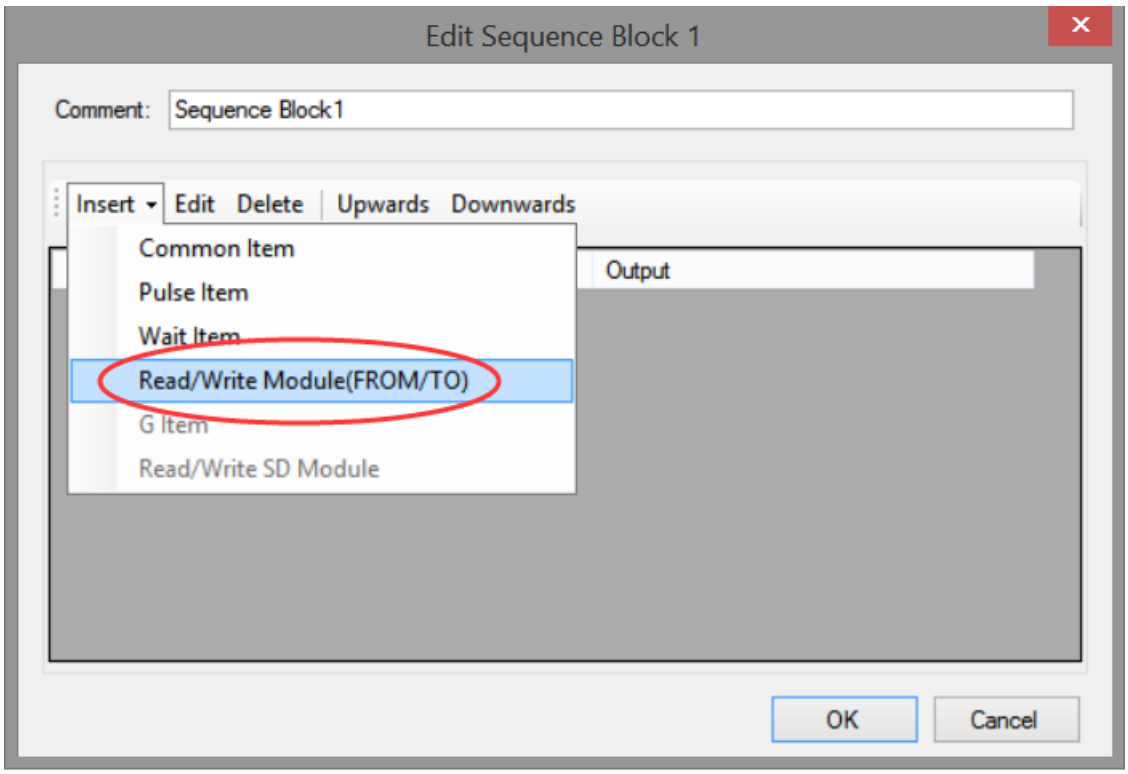
1. resonance frequency is the fixed vibration interference generated by machine, it will be tested when

installing the machine at the beginning.
2. repower on the module, confirm the parameters are set.
3. set ON Y10000, module will automatically measure the resonance frequency, monitor the ID10000, if it shows the measuring frequency, set OFF Y10000.

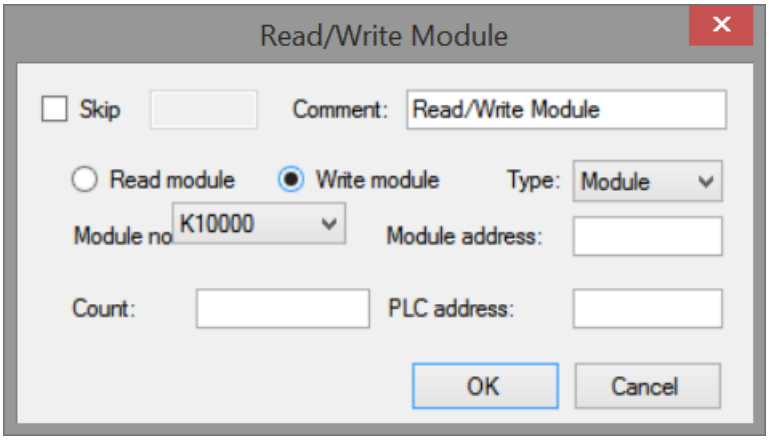
Calibration:
Please calibrate the pressure sensor for the first time using.
Take module channel 1 as an example:
1. make sure the module connected to the weighting system. Please check if the value in ID10000 fluctuated (the fluctuation range is related to sensor range), the pressure value is increasing as the load increasing. If ID10000 has no value, please check the sensor wiring. If the pressure value is decreasing as the load increasing, the sensor positive and negative point may connect backward.
2. make the pressure sensor without load, set to zero after the scale is stable, set ON Y10002(set to zero enable bit).
3. put the load on the scale, write in the load weight by instruction TO, calibrate the system after the scale is stable, set ON Y10003(calibration enable bit). The calibration completed when ID10002 is same to the load weight, set OFF Y10003.
4. Hereto, the calibration finished. The module will automatic adjust the result according to the idle load value and calibration value when weighing, and finally get the correct weight.

11-9. Instruction FROM and TO

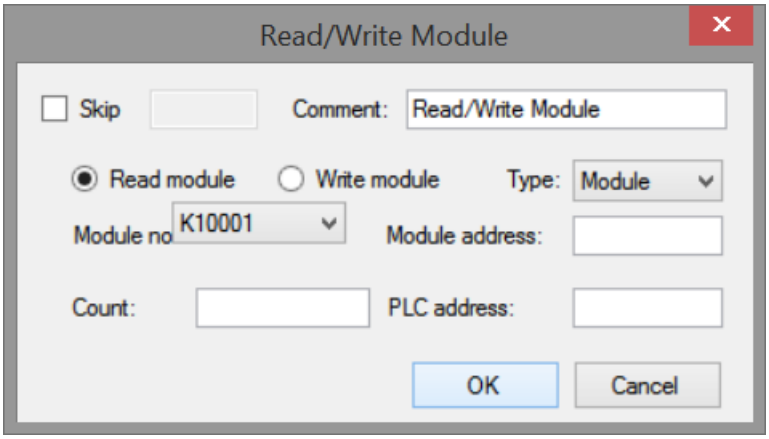
The reading and writing of XD-E2WT-B module needs to be completed through the FROM/TO instruction in the sequential function block, as shown in the figure below:



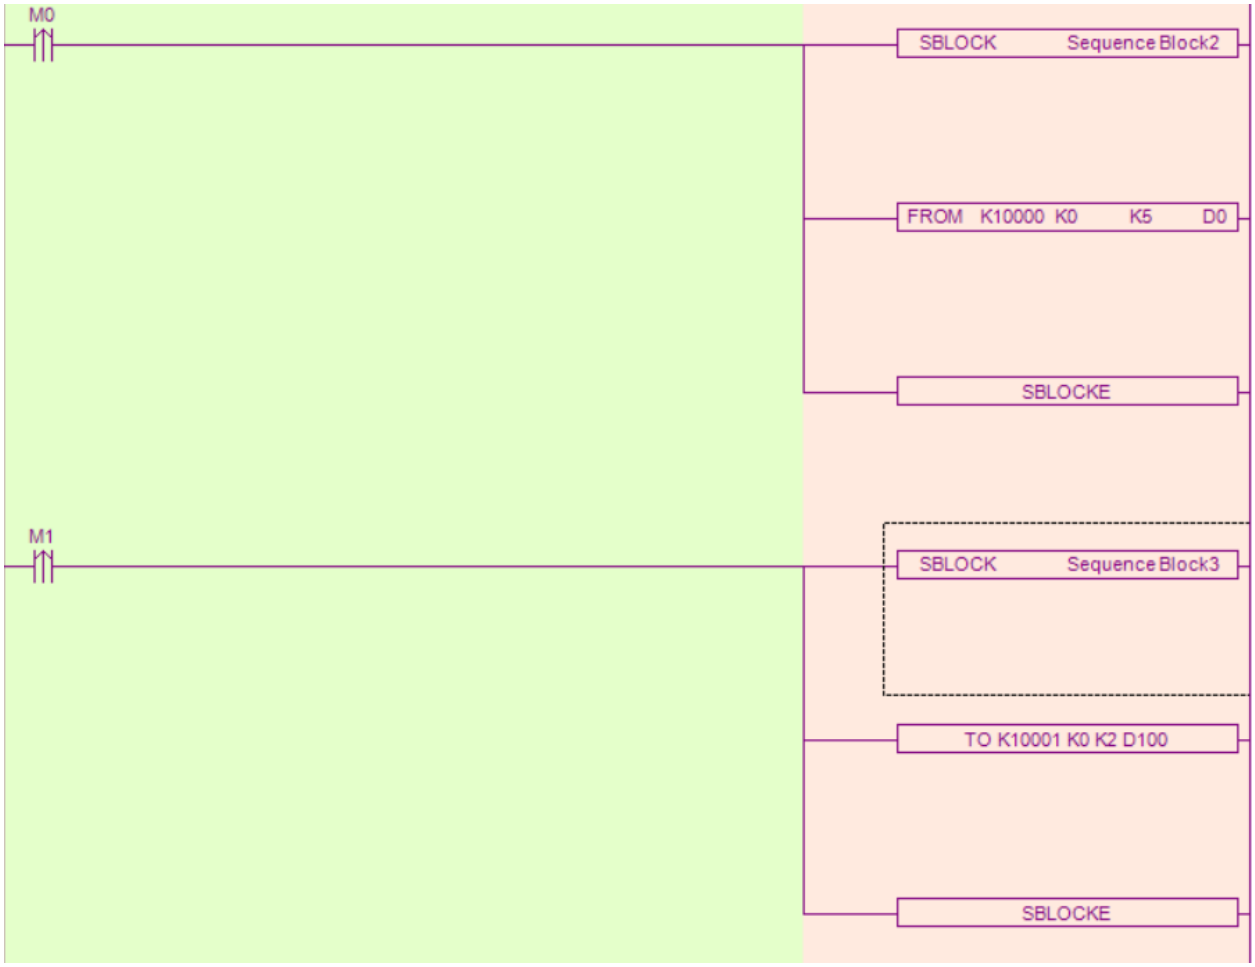
(a) Insert FROM/TO module



(b) Write instruction

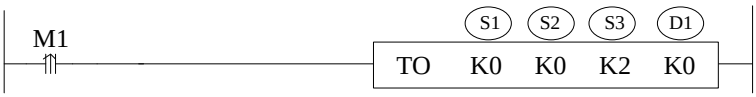


(c) Read instruction



(d) Ladder chart

Write instruction TO



Function: write the PLC register data to module specified address, the unit is word.

Operand:

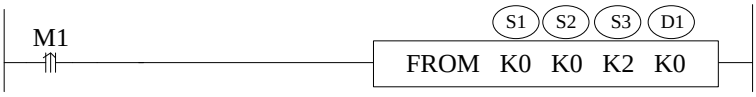
S1: target module number. Operand: K, TD, CD, D, FD.

S2: module first address. Operand: K, TD, CD, D, FD.

S3: write in register quantity. Operand: K, TD, CD, D, FD.

D1: write in data first address in PLC.

Read instruction FROM



Function: read the module data to PLC register, the unit is word.

Operand:

S1: target module number. Operand: K, TD, CD, D, FD.

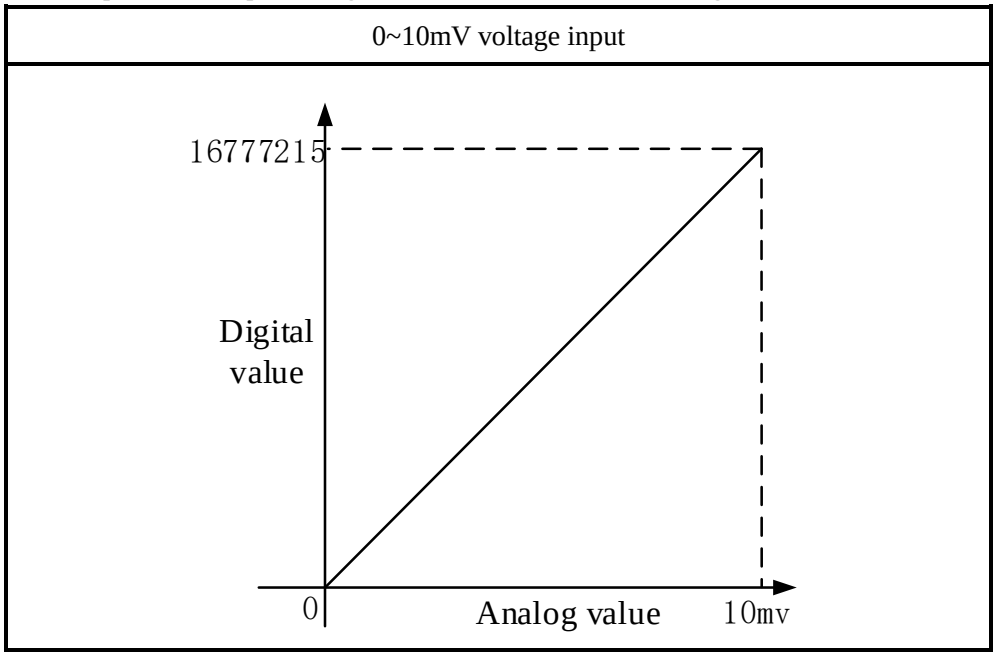
S2: module first address. Operand: K, TD, CD, D, FD.
S3: read register quantity. operand: K, TD, CD, D, FD.
D1: PLC register first address.

Note:

1. From/TO instruction can only be written in sequence function block, XD series PLC with firmware version less than v3.4.5 only allows up to 8 function blocks; XD/XL series PLC with firmware version v3.4.5 and above can write up to 100 blocks in the program, but can only run up to 8 blocks at the same time.
2. The starting number of module starts from k10000, k10000 is module 1 and k10001 is module 2. By analogy, module 16 is K10015.

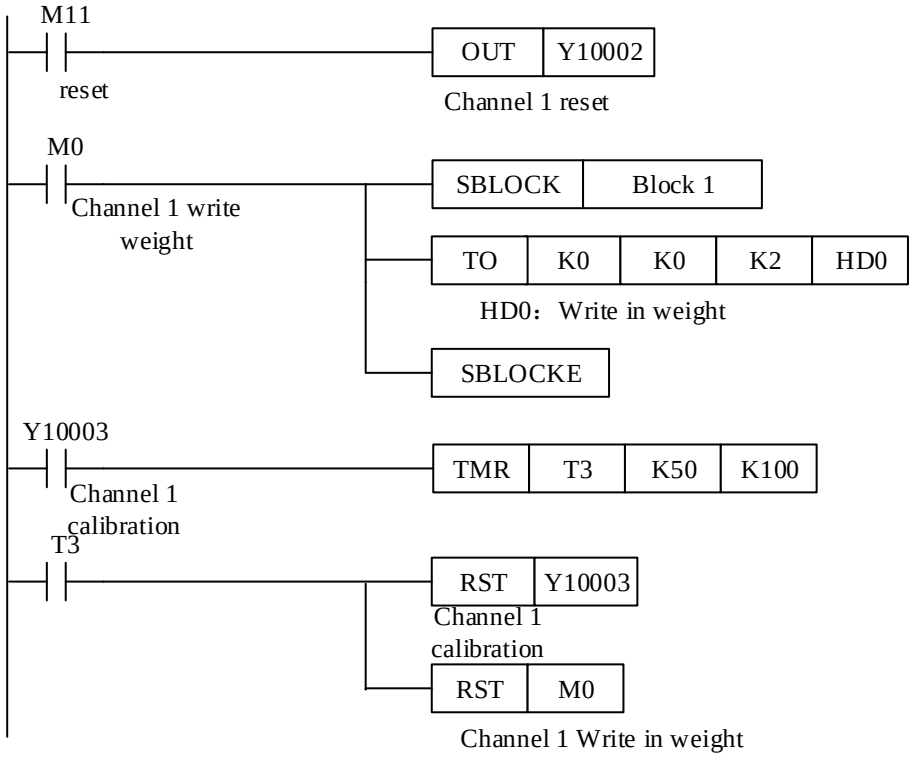
11-10. A/D transformation diagram

The relationship between input voltage value and A/D transformed digital value:



11-11. Application program

Take module 1 channel 1 as an example:



Explanation:

Set to zero through Y10002.

Write in the weight value through instruction TO. First store the weight value in HD0, set ON M0, write the value of HD0 to module 1 channel 1.

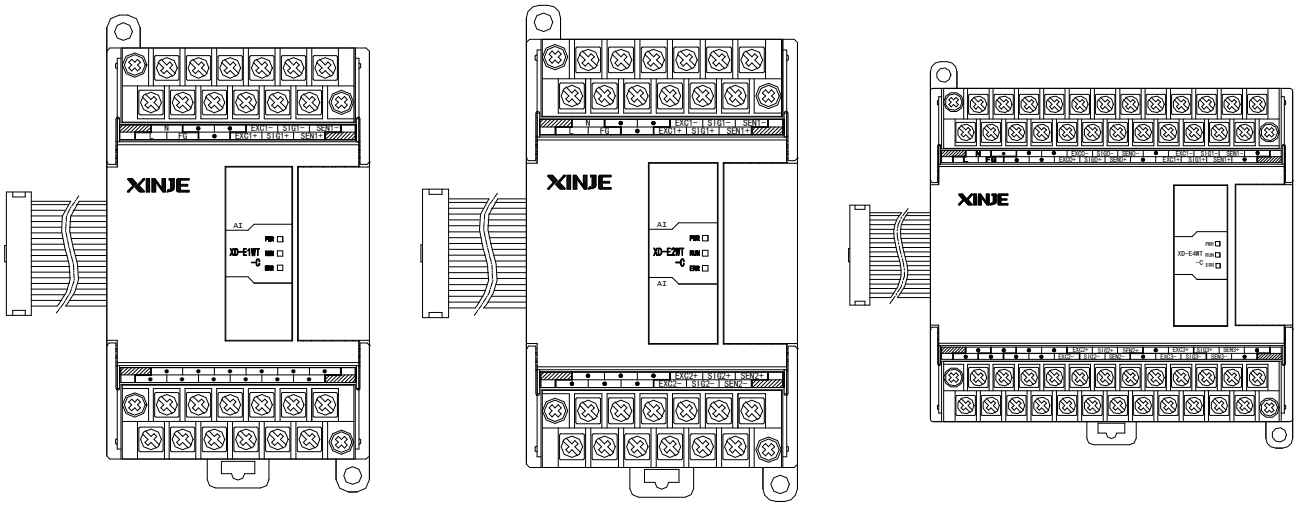
Calibrate the scale through Y10003. The calibration is finished when the weight value is equal to the weight display value.

12. N channels pressure module XD-EnWT-C

12-1. Features

This chapter mainly introduces XD-E1WT-C, XD-E2WT-C, XD-E4WT-C module specifications, terminal description, system composition, module functions and parameters, external connections, analog-to-digital conversion diagram and related programming examples.

XD-E1WT-C **XD-E2WT-C** **XD-E4WT-C**



Features:

The 1, 2, 4 channels of pressure measurement module XD-EnWT-C, as an extension module of XD series PLC, can be used to detect the voltage signal of 0~10mV or collect the voltage signal of pressure sensor, and convert the analog voltage value into digital value through A/D and carry out operation.

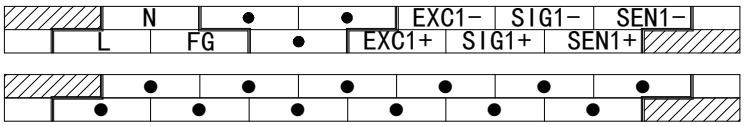
- The analog voltage signal of 1 / 2 / 4 channel pressure sensor can be collected.
- It can detect the voltage signal of 0-10mV.
- 20-bit high precision A / D conversion.
- As a special function module of XD series, XD3 can connect up to 10 modules on the right side of PLC main unit, XD5/XDM/XDC/ XD5E/XDME can expand 16 modules, XD1/XD2 does not support expansion modules.

Specifications:

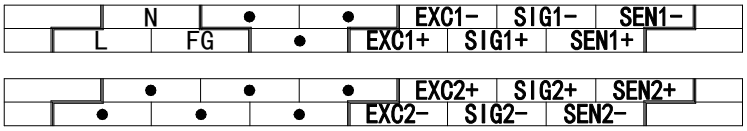
Input range	DC 0~10mV (sensor 2mv/v)
AD real resolution	1/1048575 (20bit)
Max display resolution	1/300000
Non-linear	0.01%F.S
Transformation speed	150/300/450 times/second (optional)
Power supply	AC220V±10% 50/60Hz
Sensor power supply	5VDC/120mA, can parallel 4 pieces of 350Ω pressure sensor
Dimension	63mm×108mm×89.9mm (XD-E1/2WT-C) 108.6×108mm×89.9mm (XD-E4WT-C)
Installation	Mount on DIN46277 rail (width 35mm) or fix with screw M3
Software version	V3.5.1 and higher version
Working environment	No corrosive gas
Ambient temperature	-10℃~50℃
Humidity	5~95%RH (no condensation)

12-2. Terminals

XD-E1WT-C:



XD-E2WT-C:



XD-E4WT-C:

XD-E1WT-C:

Channel	Terminal	Signal	Meaning
CH1	EXC1+	Excitation +	Connect to sensor power supply input
	EXC1-	Excitation -	
	SIG1+	Signal +	Connect to sensor signal output
	SIG1-	Signal -	
	SEN1+	Feedback +	Connect to sensor feedback voltage output
	SEN1-	Feedback -	
-	L, N	Module power supply	Give power to module, AC220V ± 10% 50/60Hz
	FG	Power supply ground	Connect to ground

XD-E2WT-C:

Channel	Terminal	Signal	Meaning
CH1	EXC1+	Excitation +	Connect to sensor power supply input
	EXC1-	Excitation -	
	SIG1+	Signal +	Connect to sensor signal output
	SIG1-	Signal -	
	SEN1+	Feedback +	Connect to sensor feedback voltage output
	SEN1-	Feedback -	
CH2	EXC2+	Excitation +	Connect to sensor power supply input
	EXC2-	Excitation -

	SIG2-	Signal -	
	SEN2+	Feedback +	Connect to sensor feedback voltage output
	SEN2-	Feedback -	
-	L, N	Module power supply	Give power to module, AC220V ± 10% 50/60Hz
	FG	Power supply ground	Connect to ground

XD-E4WT-C:

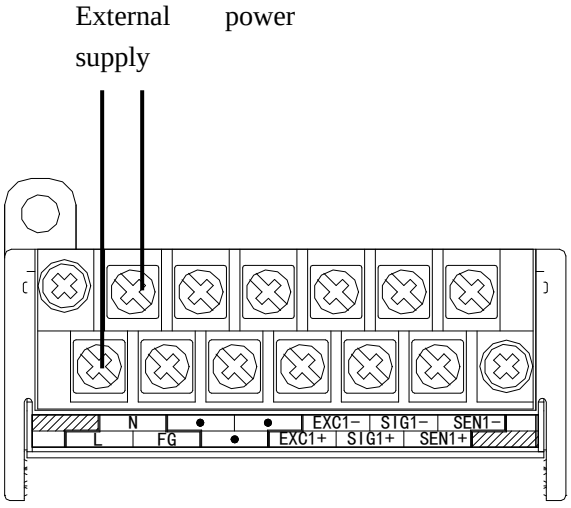
Channel	Terminal	Signal	Meaning
CH1	EXC0+	Excitation +	Connect to sensor power supply input
	EXC0-	Excitation -	
	SIG0+	Signal +	Connect to sensor signal output
	SIG0-	Signal -	
	SEN0+	Feedback +	Connect to sensor feedback voltage output
	SEN0-	Feedback -	
CH2	EXC1+	Excitation +	Connect to sensor power supply input
	EXC1-	Excitation -	

	SIG1+	Signal +	Connect to sensor signal output
	SIG1-	Signal -	
	SEN1+	Feedback +	Connect to sensor feedback voltage output
	SEN1-	Feedback -	
CH3	EXC2+	Excitation +	Connect to sensor power supply input
	EXC2-	Excitation -	
	SIG2+	Signal +	Connect to sensor signal output
	SIG2-	Signal -	
	SEN2+	Feedback +	Connect to sensor feedback voltage output
	SEN2-	Feedback -	
CH4	EXC3+	Excitation +	Connect to sensor power supply input
	EXC3-	Excitation -	
	SIG3+	Signal +	Connect to sensor signal output
	SIG3-	Signal -	
	SEN3+	Feedback +	Connect to sensor feedback voltage output
	SEN3-	Feedback -	
-	L, N	Module power supply	Give power to module, AC220V ± 10% 50/60Hz
	FG	Power supply ground	Connect to ground

12-3. External connection

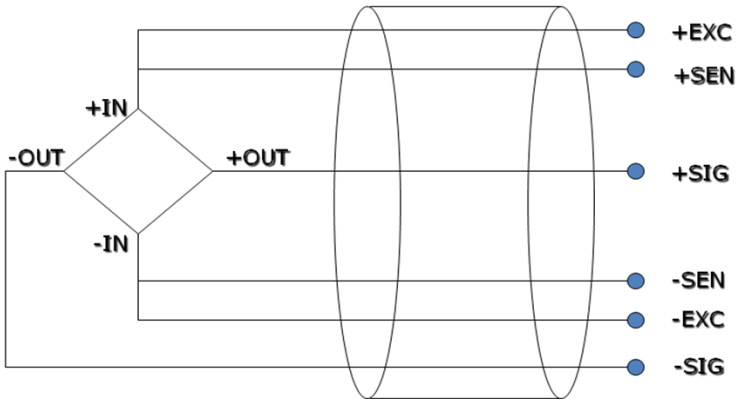
Please use shield cable and single-point connect to the ground for shield layer.

Power supply wiring

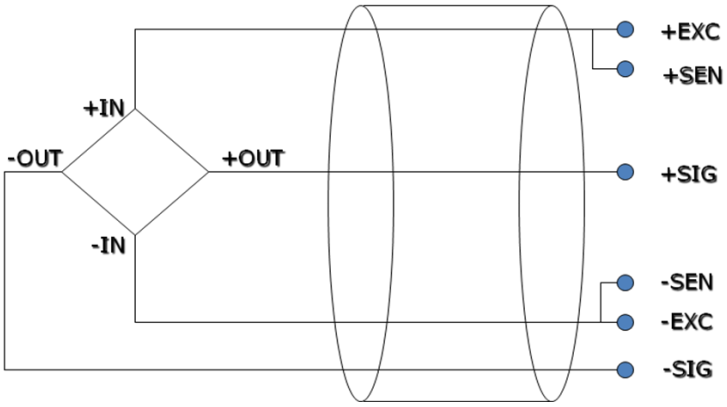


Connect to sensor

6 wires mode:



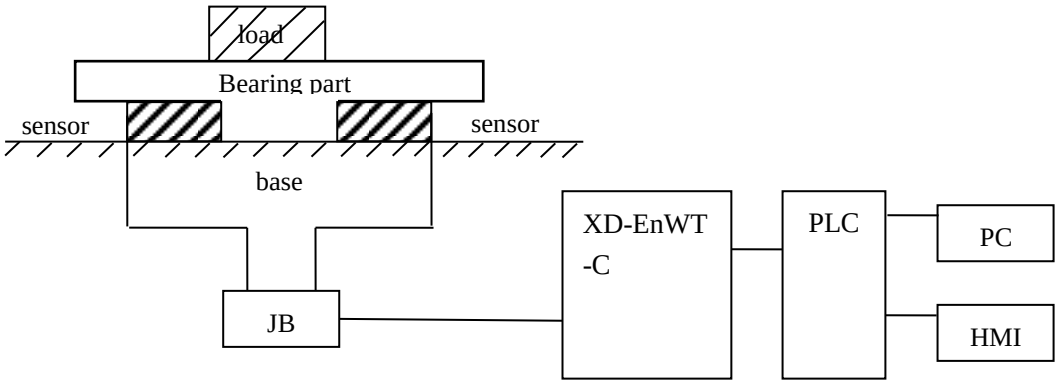
4 wires mode:



Note: short connect EXC1- and SEN1-, short connect EXC1+ and SEN1+ for 4 wires mode sensor.

12-4. Weighing system

A typical weighing system:



Loading bearing part: to support the load. Such as flat, hopper, container, air transport car…
Pressure sensor: transform the weight to voltage signal.
Assembly part: make sure the pressure sensor can work correctly, assembly part and direct part can avoid overload. Overload will cause measurement error and sensor damage.
Connection box (JB): to collect several sensor signals.
XD-EnWT-C: can be used as an electronic assessment device, it gets the pressure sensor signal and makes further assessment.

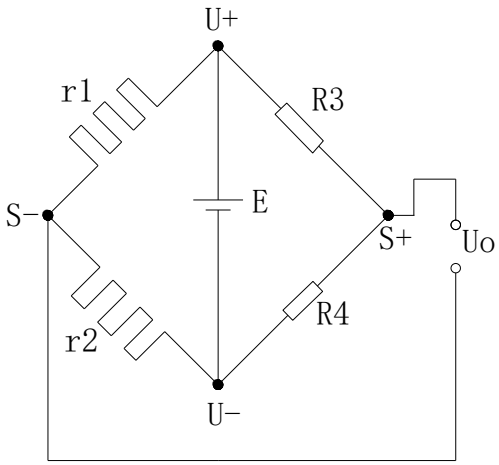
12-5. Module functions

XD-EnWT-C has the follow functions:

- Adjust the pressure sensor
- Collect the pressure sensor signal
- Calculate the weight value
- 0～10mV voltage signal test

12-5-1. Pressure sensor

The pressure sensor is based on resistance strain effect, see the following diagram:



R1 and R2 is strain resistor which make bridge circuit with R3 and R4. With the change of R1 and R2, the

bridge circuit will lose the balance, unbalance voltage Uo will be produced as the output of sensor.
U+ and U- are positive and negative point of the sensor power supply. Please select the 5V power of the module or from outside.
S+ and S- are positive and negative point of the sensor output. Connect the output to the module to test the weight.

12-6. I/O address

The I/O address of module 1:

Soft component		Address	Explanation	Note
Output coil	CH1	Y10000	Filter level	
		Y10001	Reset

	CH3	ID11508	Present weight	Double words
		ID11510	Present digital value/present input voltage	Double words
	CH4	ID11512	Present weight	Double words
		ID11514	Present digital value/present input voltage	Double words

Note: XD-E1WT-C has no CH2~CH4, XD-E2WT-C has no CH3~CH4.

Address explanation:

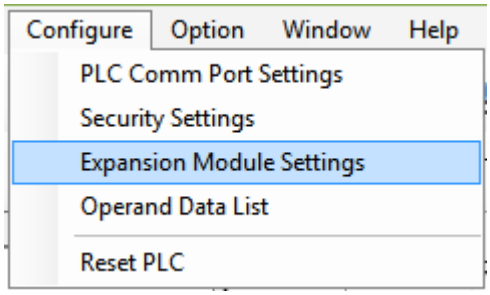
filter level	ON: filter level A, OFF: filter level B
Reset	The reset is valid in the reset range, not save zero point
zero point calibration	To calibrate the system zero point
gain calibration	To calibrate system linear
Stable flag	The signal output is effective when meeting the stable range and time
Overflow flag	When the signal voltage larger than 10mv, this signal output is effective
Calibration success flag	This signal output is effective when zero point calibration and gain calibration succeeded
Calibration failure flag	This signal output is effective when zero point calibration and gain calibration failed (the detailed reasons please check module applicatoin error info)
Present digital value/present input voltage	Switch through upper device, when it is switched to present input voltage, the unit is mv, the decimal place is 4 bits

12-7. Working mode

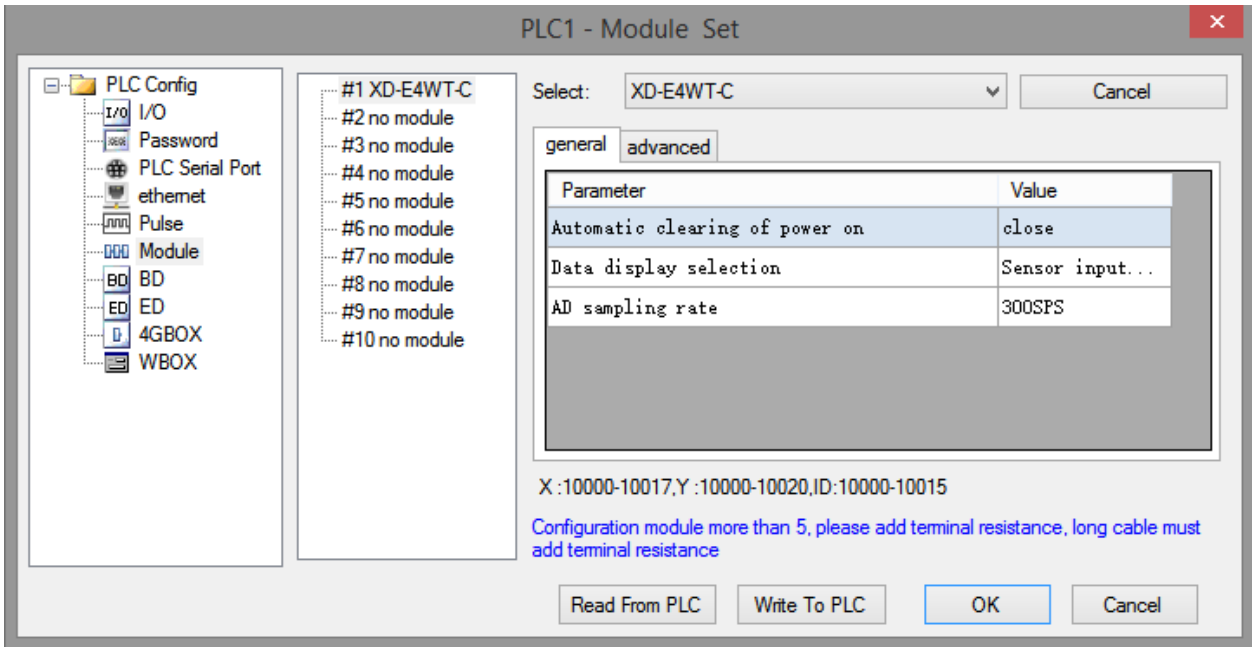
There are two method to set the working mode:

1. set through the control panel
2. set through Flash register

Open the XD PLC software, click the menu configure/expansion module setting.



Choose the correct model and configuration information:



Flash register setting:

The expansion module can set the gear and user-defined fast sampling frequency through PLC flash register SFD.

Module no.	SFD address	Module no.	SFD address
#1	SFD350~SFD359	#9	SFD430~SFD439
#2	SFD360~SFD369	#10	SFD440~SFD449
#3	SFD370~SFD379	#11	SFD450~SFD459
#4	SFD380~SFD389	#12	SFD460~SFD469
#5	SFD390~SFD399	#13	SFD470~SFD479

#6	SFD400~SFD409	#14	SFD480~SFD489
#7	SFD410~SFD419	#15	SFD490~SFD499
#8	SFD420~SFD429	#16	SFD500~SFD509

SFD350~SFD359 register explanation:

SFD		Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	NOTE
SFD350	Byte0	AD sampling speed Range 0~2 Initial value: 1 0: 150 time/second 1: 300 time/second 2: 450 time/second						Sampling data mode Initial value: 0 0: sensor input voltage (mv) 1: AD sampling digital value	Automatical reset when power on Intial value: 0 0: OFF 1: ON	All the channels
	Byte1	-								

12-8. Module setting

Module parameter list:

Address	Contents	Explanation		Features
K0	Zero point tracking range	Range: 0~9 Initial value: 5	All the channels	Word R/W
K1	Zero point tracking time	Range: 500~5000 (ms) Initial value: 2000		Word R/W
K2	Reset range	Range: 1~99 (%) Initial value: 50		Word R/W
K3	Stable range	Range: 1~99 Initial value: 3		Word R/W
K4	Stable time	Range: 10~5000 (ms) Initial value: 100		Word R/W
K5	Filter level A	Range: 0~9 Initial value: 3		Word R/W
K6	Filter level B	Range: 0~9 Initial value: 5		Word R/W

K7~K9	Reserved			
K10	Zero point calibration voltage return value	Return the present sensor input voltage after calibrating the zero point	CH1	Dword R
K12	Gain calibration digital value/gain calibration voltage return value	As weight input value for gain calibration. As return relative voltage for non-calibration		Dword R/W
K14	CH1 min scale division	Range: 1,2,5,10,20,50		Word R/W
K15	CH1 max range	Range: <1000000		Dword R/W
K17	Reserved			
K20	Zero calibration voltage return value	Return the present sensor input voltage after calibrating the zero point	CH2	Dword R
K22	Gain calibration value/gain calibration voltage return value	As weight input value for gain calibration. As return relative voltage for non-calibration		Dword R/W
K24	CH2 min scale division	Range: 1,2,5,10,20,50		Word R/W
K25	CH2 max range	Range: <1000000		Dword R/W
K27	Reserved			
K30	Zero calibration voltage return value	Return the present sensor input voltage after calibrating the zero point		Dword R
K32	Gain calibration value/gain calibration voltage return value	As weight input value for gain calibration. As return relative voltage for non-calibration	CH3	Dword R/W
K34	CH3 min scale division	Range: 1,2,5,10,20,50		Word R/W
K35	CH3 max range	Range: <1000000		Dword R/W
K37	Reserved			
K40	Zero calibration voltage return value	Return the present sensor input voltage after calibrating the zero point	CH4	Dword R
K42	Gain calibration value/gain calibration voltage return value	As weight input value for gain calibration. As return relative voltage for non-calibration		Dword R/W
K44	CH4 min scale division	Range: 1,2,5,10,20,50		Word R/W
K45	CH4 max range	Range: <1000000		Dword R/W
K47	Reserved			

Parameter notes:

1. Zero-point tracking range and time: If the weight value fluctuates in the range of K0 of zero point and the fluctuation lasts for K1 time, it is considered that the fluctuation value in this range is not recorded, and the weight value is displayed as 0.
2. Reset range: It is allowed to perform the reset action within the proportion range of the parameter maximum range.

3. Stable range and time: When the difference between the last weight value and the previous weight value is in K3 range and maintains K4 time, it is considered that the weight value at this time has been stable.

Take module no.1 as an example:

Weight unit setting:

Write in weight through instruction TO. For example, the object weight is 1kg, write in 1 means the unit is kg, write in 1000 means the unit is g, write in 10000 means the unit is 0.1g. resolution=1kg/write in digital value.

Calibration:

Please calibrate the pressure sensor for the first time using.

Take module channel 1 as an example:

1. confirm whether the module and sensor work properly.

Judgment method:

First, monitor whether the overflow flag X10001 is OFF state. If it is ON, the sensor is not connected or the sensor is damaged.

Second, using the software to monitor whether ID10002 value fluctuates following sensor (fluctuation range is related to sensor range), and pressure value increased when increasing the load, if there are value but increase the load stress value decreases, that means (1) sensor installed opposite, please adjust the sensor position or exchange +/- of sensor output signal; (2) The incoming voltage signal has been overflow, reducing the load appropriately.

2. Make the sensor no load, after the stable flag X10000 is ON, set ON zero-point calibration Y10002. X10002 ON means the zero-point calibration is successful. If after few seconds, X10003 is ON, that means zero-point calibration is failed.

3. Put the load whose weight is known on the scale, write the weight through TO instruction, after stable flag X10000 is ON, set ON gain calibration Y10003, X10002 ON means calibration is successful, shut off Y10003. If after few seconds, X10003 is ON, that means zero-point calibration is failed.

4. Hereto, the calibration finished. The module will automatic adjust the result according to the idle load value and calibration value when weighing, and finally get the correct weight.

12-9. Module error info

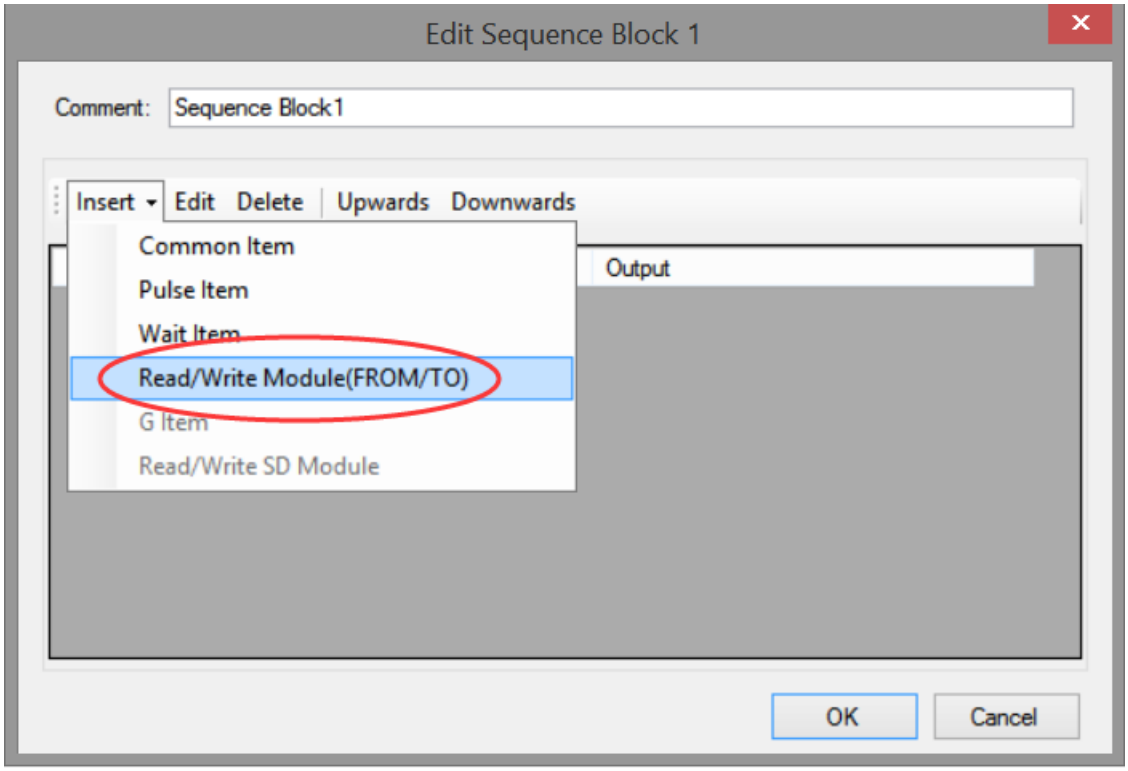
Serious application error (related to main unit register address SD503 high 8 bits)

Error code			Meaning
Binary	Hex	Decimal	
0000 0001	0x01	1	Not connect 24V
0000 0010	0x02	2	Not finish the setting in 5s
0000 0011	0x03	3	Module model is different
0000 0011	0x04	4	Communicate with PLC error

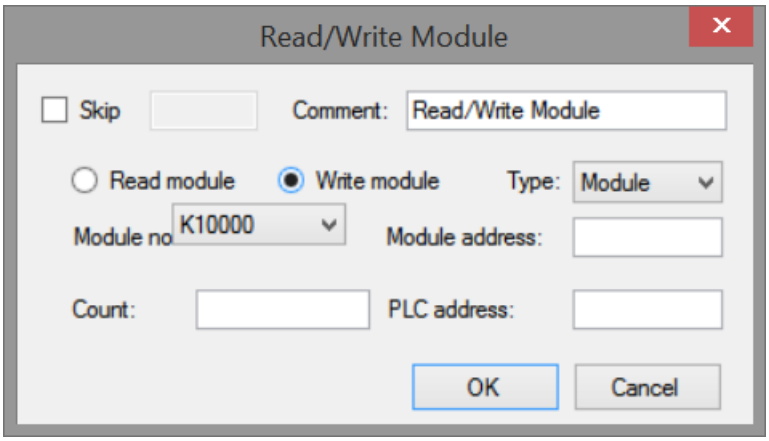
The error code using method: write in module no. in SD500, if it needs to check module no.1 error code, please write in 10000.

12-10. Instruction FROM and TO

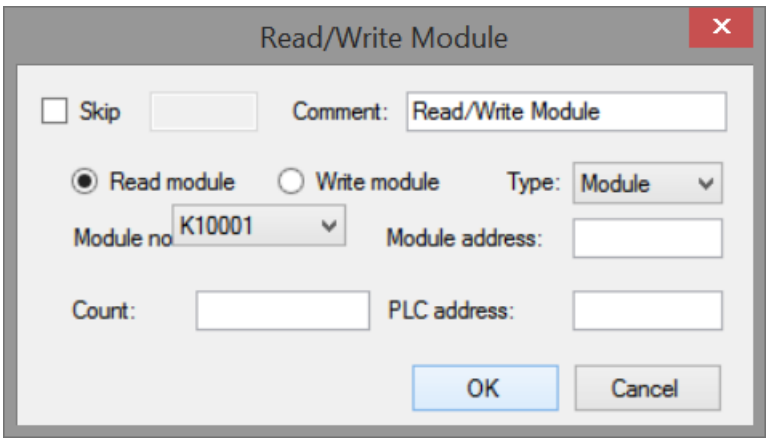
The reading and writing of XD-EnWT-C module needs to be completed through the FROM/TO instruction in the sequential function block, as shown in the figure below:



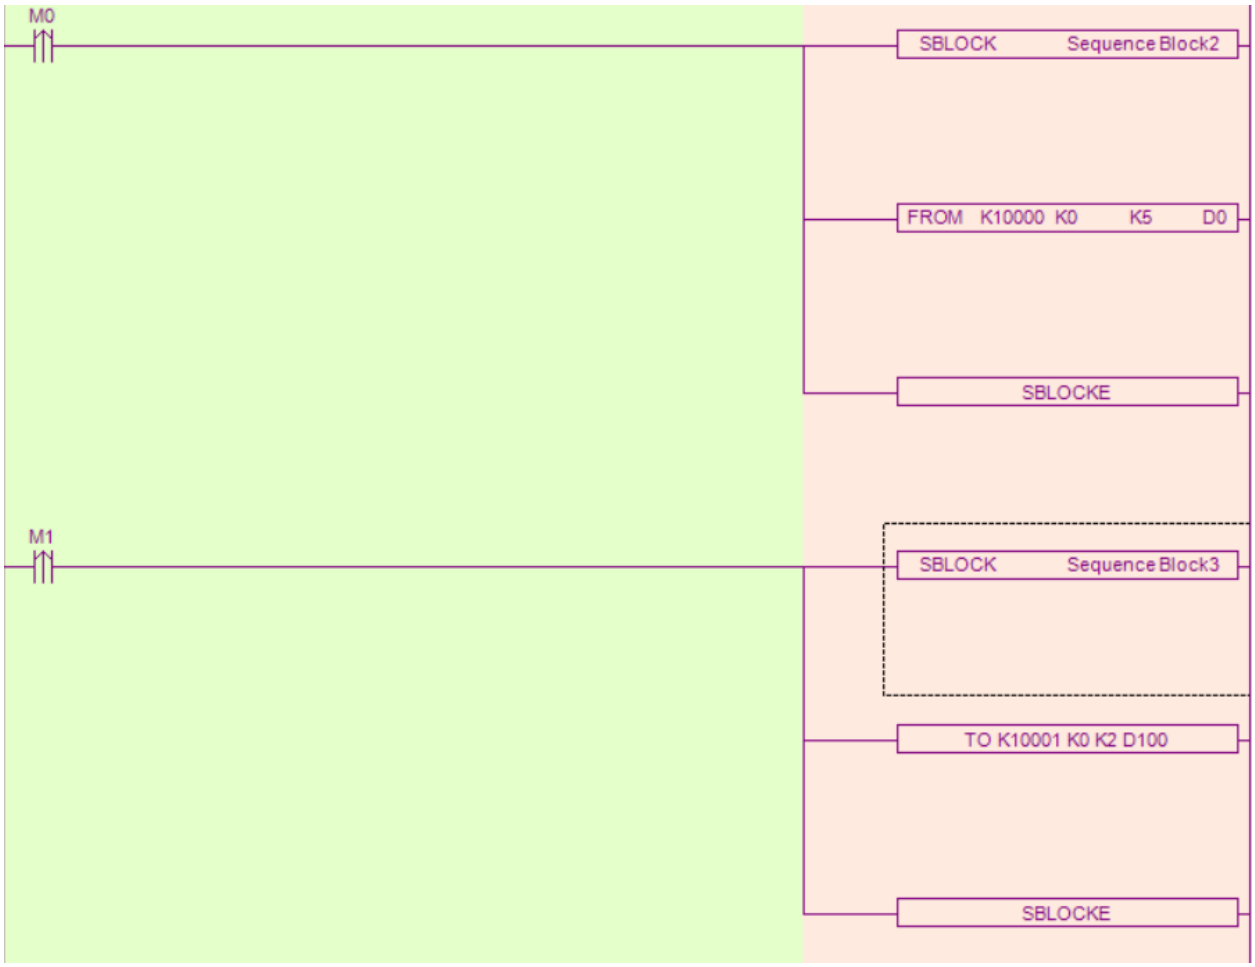
(a) Insert FROM/TO module



(b) Write instruction

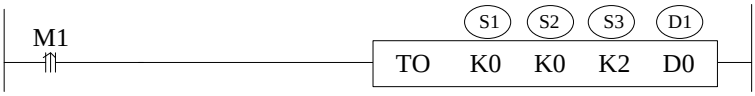


(c) Read instruction

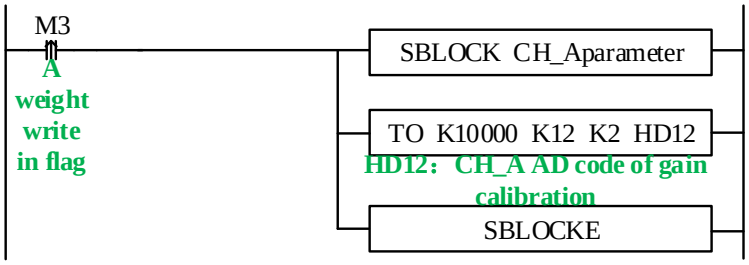


(d) Ladder chart

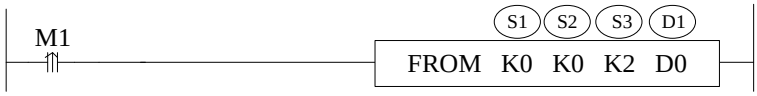
Write instruction TO



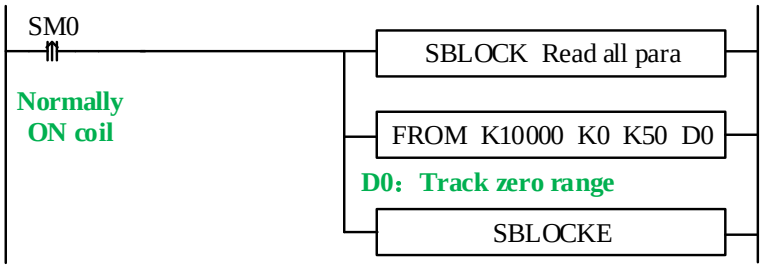
Function: write the PLC register data to module specified address, the unit is word.
Operand:
S1: target module number. Operand: K, TD, CD, D, HD, FD.
S2: module first address. Operand: K, TD, CD, D, HD, FD.
S3: write in register quantity. Operand: K, TD, CD, D, HD, FD.
D1: write in data register first address in PLC. Operand: TD, CD, D, HD, FD.
Example: write the weight value to module no.1 channel 1



Read instruction FROM



Function: read the module data to PLC register, the unit is word.
Operand:
S1: target module number. Operand: K, TD, CD, D, HD, FD.
S2: module first address. Operand: K, TD, CD, D, HD, FD.
S3: read register quantity. Operand: K, TD, CD, D, HD, FD.
D1: PLC register first address. Operand: TD, CD, D, HD, FD.
For example: read all the parameters of module no.1

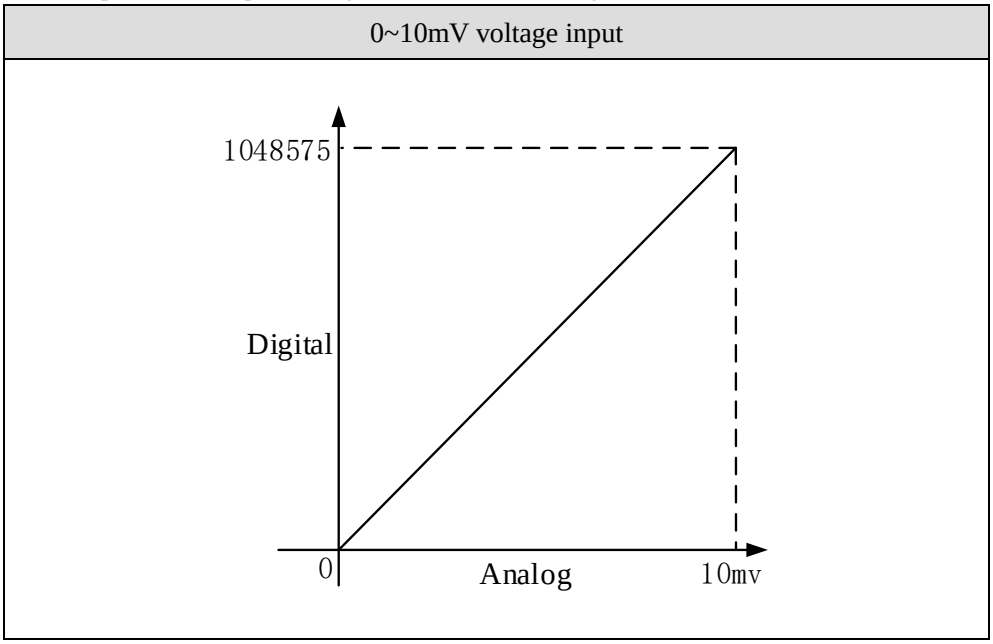


Note:

1. From/TO instruction can only be written in sequence function block, XD series PLC with firmware version less than v3.4.5 only allows up to 8 function blocks; XD/XL series PLC with firmware version v3.4.5 and above can write up to 100 blocks in the program, but can only run up to 8 blocks at the same time.
2. The starting number of module starts from k10000, k10000 is module 1 and k10001 is module 2. By analogy, module 16 is K10015.

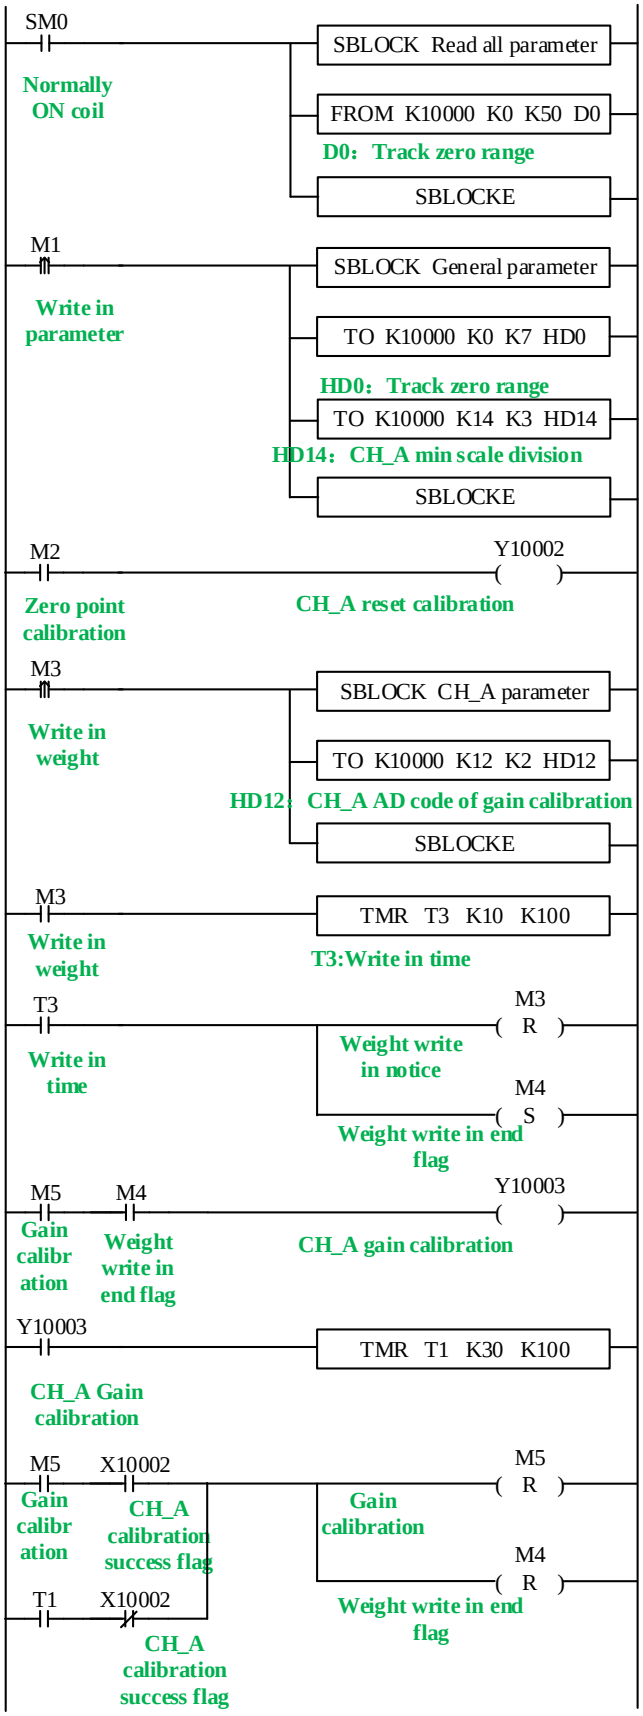
12-11. AD transformation diagram

The relationship between input voltage and transformed digital value is shown as below:



12-12. Application program

Take module 1 as an example:



SM0
SBLOCK Read all parameter
Normally ON coil
FROM K10000 K0 K50 D0

Gain calibration
M4
R
T1
X10002
Weight write in end flag
CH_A calibration success flag

Explanation:

Read all the parameters and write in general parameters through FROM/TO instruction.

Set ON M1, write in all the parameters of channel 1.

Zero-point calibration: set ON M2, if zero-point calibration is successful, X10002 is set ON.

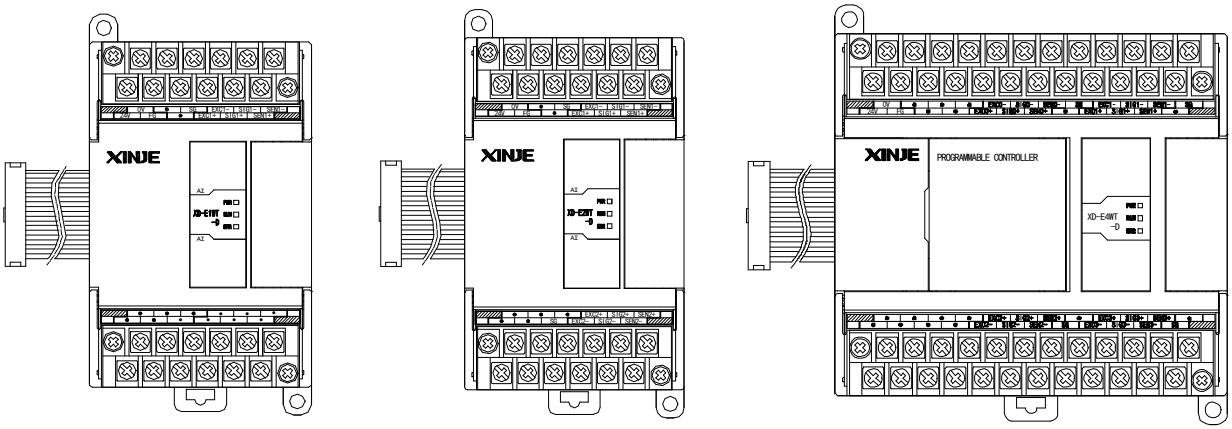
Gain calibration: first set ON M3, write the weight value HD12 to the module. After write in success flag M4 is ON, it starts to calibrate gain. Set ON M5 to start the calibration, the preset stable time is 3s. after the scale is stable, gain calibration success flag X10002 is ON or calibration time T1 reached, reset M4, M5, gain calibration is finished.

13. N channels pressure module XD-EnWT-D

13-1. Features

This chapter mainly introduces XD-E1WT-D, XD-E2WT-D, XD-E4WT-D module specifications, terminal description, system composition, module functions and parameters, external connections, analog-to-digital conversion diagram and related programming examples.

XD-E1WT-D **XD-E2WT-D** **XD-E4WT-D**



Features:

The 1, 2, 4 channels of pressure measurement module XD-EnWT-C, as an extension module of XD series PLC, can be used to detect the voltage signal of -20~20mV or collect the voltage signal of pressure sensor, and convert the analog voltage value into digital value through A/D and carry out operation.

- The analog voltage signal of 1 / 2 / 4 channel pressure sensor can be collected.
- It can detect the voltage signal of -20~20mV.

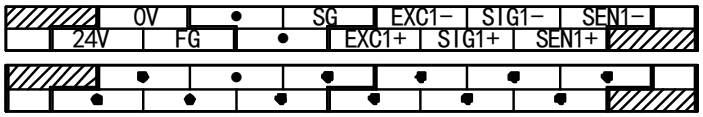
- 23-bit high precision A / D conversion.
- As a special function module of XD series, XD3 can connect up to 10 modules on the right side of PLC main unit, XD5/XDM/XDC/ XD5E/XDME can expand 16 modules, XD1/XD2 does not support expansion modules.

Specifications:

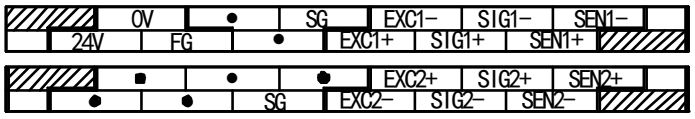
Input range	DC -20~20mV
AD real resolution	1/8388607 (23Bit)
Max display resolution	1/500000
Non-linear	0.01%F.S
Transformation speed	150/300/450 times/second (optional)
Power supply	DC24V±10%
Sensor power supply	5VDC/120mA, can parallel 4 pieces of 350Ω pressure sensor
Dimension	63mm×108mm×89.9mm (XD-E1/2WT-D) 108.6×108mm×89.9mm (XD-E4WT-D)
Installation	Mount on DIN46277 rail (width 35mm) or fix with screw M3
Software version	V3.5.3 and higher version
Working environment	No corrosive gas
Ambient temperature	-10℃~50℃
Humidity	5~95%RH (no condensation)

13-2. Terminals

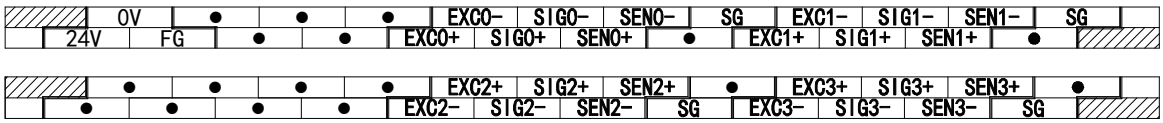
XD-E1WT-D:



XD-E2WT-D:



XD-E4WT-D:



XD-E1WT-D:

Channel	Terminal	Signal	Meaning
CH1	EXC1+	Excitation +	Connect to sensor power supply input
	EXC1-	Excitation -	
	SIG1+	Signal +	Connect to sensor signal output
	SIG1-	Signal -	
	SEN1+	Feedback +	Connect to sensor feedback voltage output
	SEN1-	Feedback -	
	SG	Signal ground	Connect to the ground
-	24V, 0V	Module power supply	Give power to module, DC24V±10%
	FG	Power supply ground	Connect to ground

XD-E2WT-D:

Channel	Terminal	Signal	Meaning
CH1	EXC1+	Excitation +	Connect to sensor power supply input
	EXC1-	Excitation -	
	SIG1+	Signal +	Connect to sensor signal output
	SIG1-	Signal -	
	SEN1+	Feedback +	Connect to sensor feedback voltage output
	SEN1-	Feedback -	
	SG	Signal ground	Connect to the ground
CH2	EXC2+	Excitation +	Connect to sensor power supply input
	EXC2-	Excitation -	
	SIG2+	Signal +	Connect to sensor signal output
	SIG2-	Signal -	
	SEN2+	Feedback +	Connect to sensor feedback voltage output
	SEN2-	Feedback -	
	SG	Signal ground	Connect to the ground
-	24V, 0V	Module power supply	Give power to module, DC24V±10%
	FG	Power supply ground	Connect to ground

XD-E4WT-D:

Channel	Terminal	Signal	Meaning
CH1	EXC0+	Excitation +	Connect to sensor power supply input
	EXC0-	Excitation -	
	SIG0+	Signal +	Connect to sensor signal output
	SIG0-	Signal -	
	SEN0+	Feedback +	Connect to sensor feedback voltage

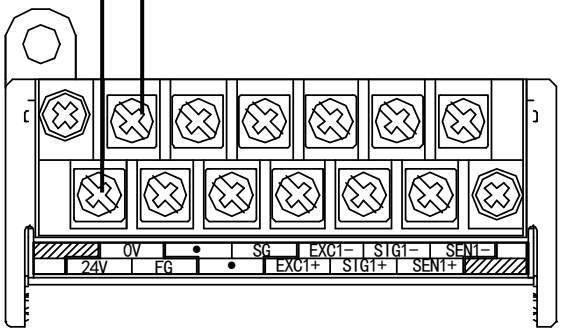
	SEN0-	Feedback -	output
	SG	Signal ground	Connect to the ground
CH2	EXC1+	Excitation +	Connect to sensor power supply input
	EXC1-	Excitation -	
	SIG1+	Signal +	Connect to sensor signal output
	SIG1-	Signal -	
	SEN1+	Feedback +	Connect to sensor feedback voltage output
	SEN1-	Feedback -	
	SG	Signal ground	Connect to the ground
CH3	EXC2+	Excitation +	Connect to sensor power supply input
	EXC2-	Excitation -	
	SIG2+	Signal +	Connect to sensor signal output
	SIG2-	Signal -	
	SEN2+	Feedback +	Connect to sensor feedback voltage output
	SEN2-	Feedback -	
	SG	Signal ground	Connect to the ground
CH4	EXC3+	Excitation +	Connect to sensor power supply input
	EXC3-	Excitation -	
	SIG3+	Signal +	Connect to sensor signal output
	SIG3-	Signal -	
	SEN3+	Feedback +	Connect to sensor feedback voltage output
	SEN3-	Feedback -	
	SG	Signal ground	Connect to the ground
-	24V, 0V	Module power supply	Give power to module, DC24V±10%
	FG	Power supply ground	Connect to ground

13-3. External connection

Please use shield cable and single-point connect to the ground for shield layer.

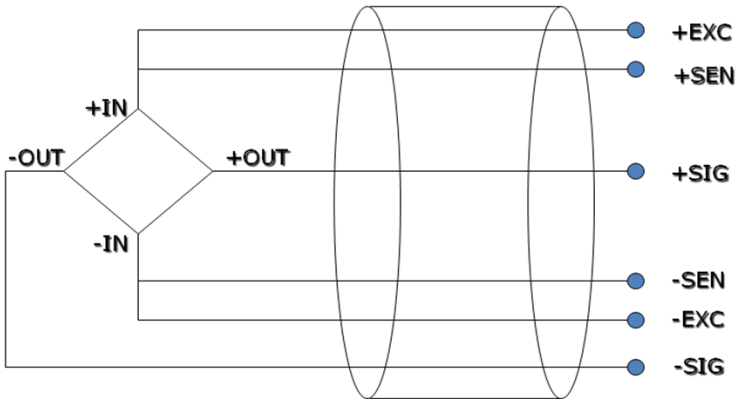
Power supply wiring

External power supply

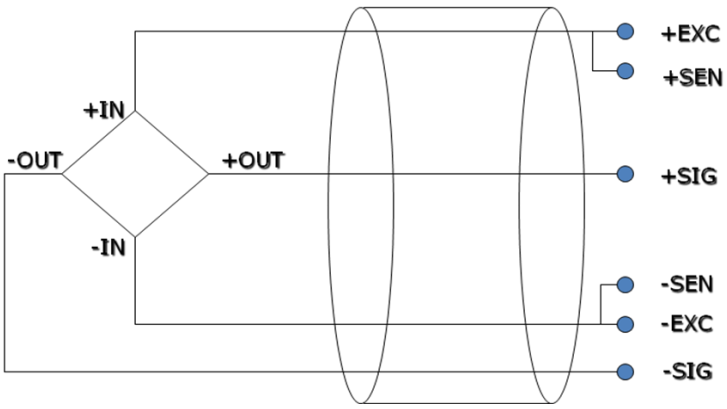


Connect to sensor

6 wires mode:



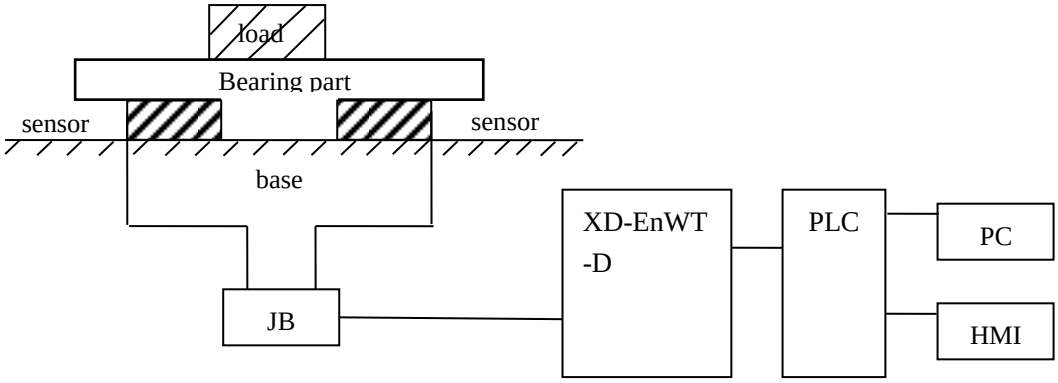
4 wires mode:



Note: short connect EXC1- and SEN1-, short connect EXC1+ and SEN1+ for 4 wires mode sensor.

13-4. Weighing system

A typical weighing system:



Loading bearing part: to support the load. Such as flat, hopper, container, air transport car…
Pressure sensor: transform the weight to voltage signal.
Assembly part: make sure the pressure sensor can work correctly, assembly part and direct part can avoid overload. Overload will cause measurement error and sensor damage.
Connection box (JB): to collect several sensor signals.
XD-EnWT-D: can be used as an electronic assessment device, it gets the pressure sensor signal and makes further assessment.

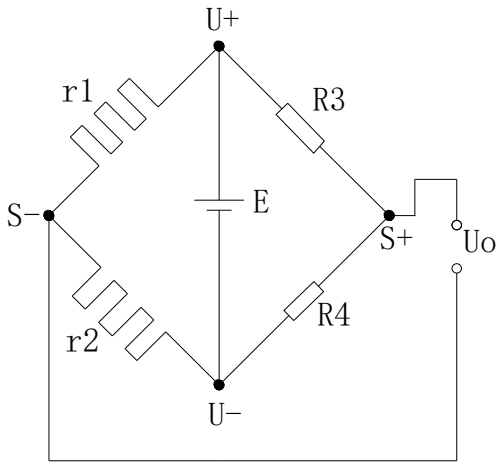
13-5. Module functions

XD-EnWT-D has the follow functions:

- Adjust the pressure sensor
- Collect the pressure sensor signal
- Calculate the weight value
- -20～20mV voltage signal test

13-5-1. Pressure sensor

The pressure sensor is based on resistance strain effect, see the following diagram:



R1 and R2 is strain resistor which make bridge circuit with R3 and R4. With the change of R1 and R2, the bridge circuit will lose the balance, unbalance voltage Uo will be produced as the output of sensor.

U+ and U- are positive and negative point of the sensor power supply. Please select the 5V power of the module or from outside.

S+ and S- are positive and negative point of the sensor output. Connect the output to the module to test the weight.

13-6. I/O address

The I/O address of module 1:

Soft component		Address	Explanation	Note
Output coil	CH1	Y10000	Filter level	
		Y10001	Reset

		ID11514	Present digital value/present input voltage	Double words

Note: XD-E1WT-D has no CH2~CH4, XD-E2WT-D has no CH3~CH4.

Address explanation:

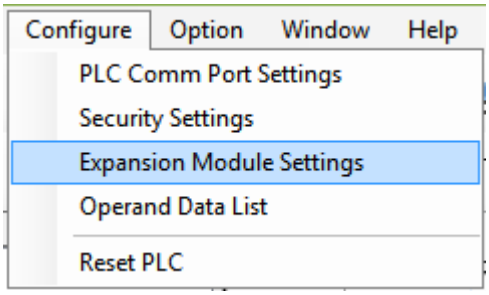
filter level	ON: filter level A, OFF: filter level B
Reset	The reset is valid in the reset range, not save zero point
zero point calibration	To calibrate the system zero point
gain calibration	To calibrate system linear
Stable flag	The signal output is effective when meeting the stable range and time
Overflow flag	When the signal voltage larger than 10mv, this signal output is effective
Calibration success flag	This signal output is effective when zero point calibration and gain calibration succeeded
Calibration failure flag	This signal output is effective when zero point calibration and gain calibration failed (the detailed reasons please check module applicatoin error info)
Present digital value/present input voltage	Switch through upper device, when it is switched to present input voltage, the unit is mv, the decimal place is 4 bits

13-7. Working mode

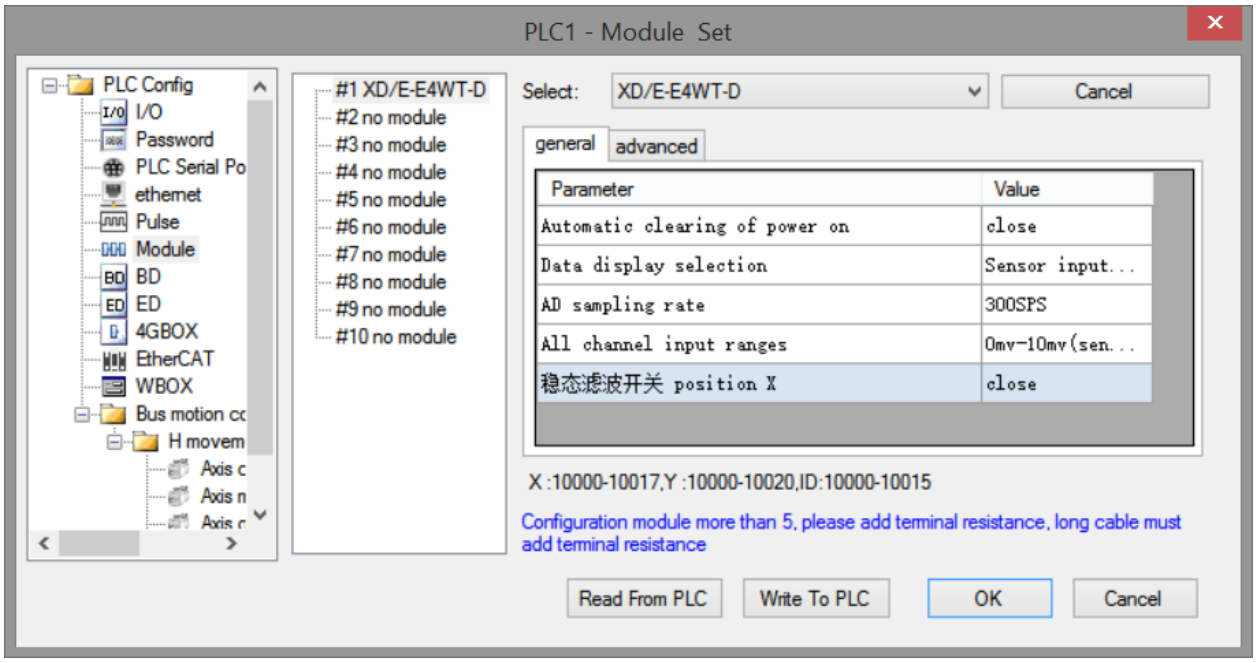
There are two methods to set the working mode:

1. set through the control panel
2. set through Flash register

Open the XD PLC software, click the menu configure/expansion module setting.



Choose the correct model and configuration information:



Parameter	Function
Automatic clearing of power on	After opening, the module will be reset automatically every time it is powered on.
Data display selection	Configuration switching can be performed. When switching to the current input voltage, the unit is mV and the decimal point is 4 digits;
AD sampling rate	Select AD sampling speed
All channel input ranges	Support -20~20mV voltage signal detection, can choose the range according to the demand
Steady state filter switch	Steady state filter switch, when set to off, the steady-state filter coefficient can be written, but it is invalid. When set to on, it is valid in steady state.

Flash register setting:

The expansion module can set the gear and user-defined fast sampling frequency through PLC flash register SFD.

Module no.	SFD address	Module no.	SFD address
#1	SFD350~SFD359	#9	SFD430~SFD439

#5	SFD390~SFD399	#13	SFD470~SFD479
#6	SFD400~SFD409	#14	SFD480~SFD489
#7	SFD410~SFD419	#15	SFD490~SFD499
#8	SFD420~SFD429	#16	SFD500~SFD509

SFD350~SFD359 register explanation:

SFD		Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	NOTE
SFD350	Byte0	AD sampling speed Range 0~2 Initial value: 1 0: 150 time/second 1: 300 time/second 2: 450 time/second				Steady state filtering 0: OFF 1: ON		Sampling data mode Initial value: 0 0: sensor input voltage (mv) 1: AD sampling digital value	Automatical reset when power on Intial value: 0 0: OFF 1: ON	All the channels
	Byte1	-								

13-8. Module setting

Module parameter list:

Address	Contents	Explanation		Features
K0	Zero point tracking range	Range: 0~9 Initial value: 5	All the channels	Word R/W
K1	Zero point tracking time	Range: 10~5000 (ms) Initial value: 2000		Word R/W
K2	Reset range	Range: 1~99 (%) Initial value: 50		Word R/W
K3	Stable range	Range: 1~99 Initial value: 3		Word R/W
K4	Stable time	Range: 10~5000 (ms) Initial value: 100		Word R/W

K5	Filter level A	Range: 0~34 Initial value: 3		Word R/W
K6	Filter level B	Range: 0~34 Initial value: 5		Word R/W
K8	Steady state filter coefficient	Range: 0~34 Initial value: 0		Word R/W
K9	-			
K10	Return value of relative digital quantity in gain calibration	Gain calibration digital vlaue-zero-point Calibration digital value	CH1	Dword R
K12	Gain calibration weight value	Gain calibration weight value		Dword R/W
K14	CH1 min scale division	Range: 1,2,5,10,20,50		Word R/W
K15	CH1 max range	Range: <= division×500000		Dword R/W
K20	Return value of relative digital quantity in gain calibration	Gain calibration digital vlaue-zero-point Calibration digital value	CH2	Dword R
K22	Gain calibration weight value	Gain calibration weight value		Dword R/W
K24	CH2 min scale division	Range: 1,2,5,10,20,50		Word R/W
K25	CH2 max range	Range: <= division×500000		Dword R/W
K27	Reserved			
K30	Return value of relative digital quantity in gain calibration	Gain calibration digital vlaue-zero-point Calibration digital value		Dword R
K32	Gain calibration weight value	Gain calibration weight value	CH3	Dword R/W
K34	CH3 min scale division	Range: 1,2,5,10,20,50		Word R/W
K35	CH3 max range	Range: <= division×500000		Dword R/W
K40	Return value of relative digital quantity in gain calibration	Gain calibration digital vlaue-zero-point Calibration digital value	CH4	Dword R
K42	Gain calibration weight value	Gain calibration weight value		Dword R/W
K44	CH4 min scale division	Range: 1,2,5,10,20,50		Word R/W
K45	CH4 max range	Range: <= division×500000		Dword R/W
K47	Reserved			

Parameter notes:

1. Zero-point tracking range and time: If the weight value fluctuates in the range of K0 of zero point and the fluctuation lasts for K1 time, it is considered that the fluctuation value in this range is not recorded, and the weight value is displayed as 0.
2. Reset range: It is allowed to perform the reset action within the proportion range of the parameter maximum range.

3. Stable range and time: When the difference between the last weight value and the previous weight value is in K3 range and maintains K4 time, it is considered that the weight value at this time has been stable.

Take module no.1 as an example:

Weight unit setting:

Write in weight through instruction TO. For example, the object weight is 1kg, write in 1 means the unit is kg, write in 1000 means the unit is g, write in 10000 means the unit is 0.1g. resolution=1kg/write in digital value.

Calibration:

Please calibrate the pressure sensor for the first time using.

Take module channel 1 as an example:

Step 1:

Confirm whether the module and sensor work properly.

Judgment method:

First, monitor whether the overflow flag X10001 is OFF state. If it is ON, the sensor is not connected or the sensor is damaged.

Second, using the software to monitor whether ID10002 value fluctuates following sensor (fluctuation range is related to sensor range), and pressure value increased when increasing the load, if there are value but increase the load stress value decreases, that means (1) sensor installed opposite, please adjust the sensor position or exchange +/- of sensor output signal; (2) The incoming voltage signal has been overflow, reducing the load appropriately.

Step 2:

Make the sensor no load, after the stable flag X10000 is ON, set ON zero-point calibration Y10002. X10002 ON means the zero-point calibration is successful. If after few seconds, X10003 is ON, that means zero-point calibration is failed.

Step 3:

Put the load whose weight is known on the scale, write the weight through TO instruction, after stable flag X10000 is ON, set ON gain calibration Y10003, X10002 ON means calibration is successful, shut off Y10003. If after few seconds, X10003 is ON, that means zero-point calibration is failed.

Step 4:

Hereto, the calibration finished. The module will automatic adjust the result according to the idle load value and calibration value when weighing, and finally get the correct weight.

13-9. Module error info

Serious application error (related to main unit register address SD503 high 8 bits)

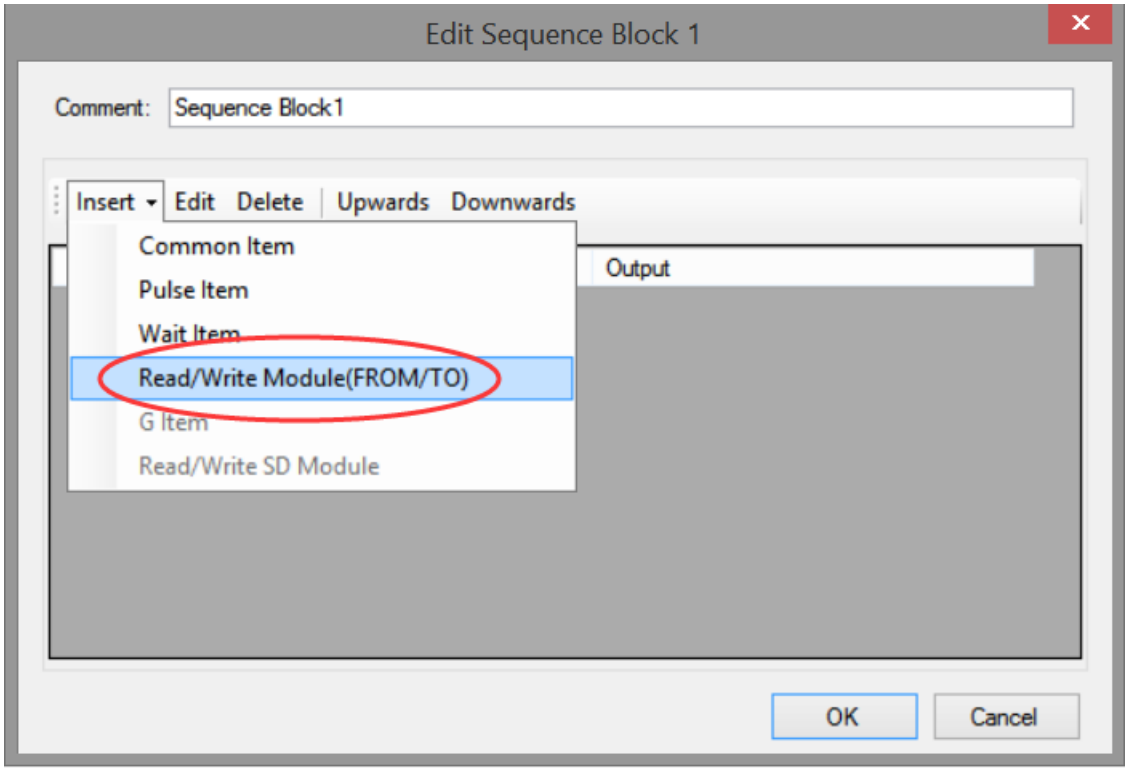
Error code			Meaning
Binary	Hex	Decimal	
0000 0001	0x01	1	Not connect 24V
0000 0010	0x02	2	Not finish the setting in 5s
0000 0011	0x03	3	Module model is different

0000 0011	0x04	4	Communicate with PLC error

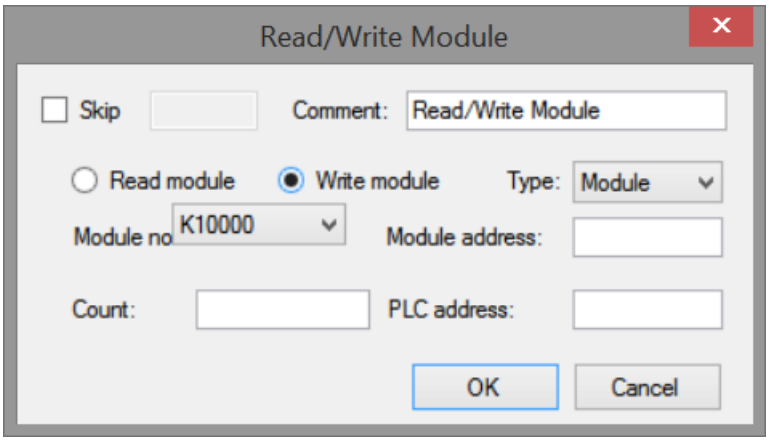
The error code using method: write in module no. in SD500, if it needs to check module no.1 error code, please write in 10000.

13-10. Instruction FROM and TO

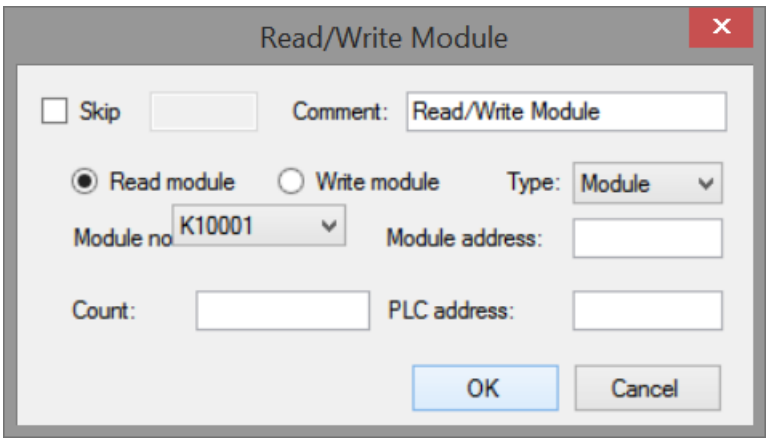
The reading and writing of XD-EnWT-D module needs to be completed through the FROM/TO instruction in the sequential function block, as shown in the figure below:



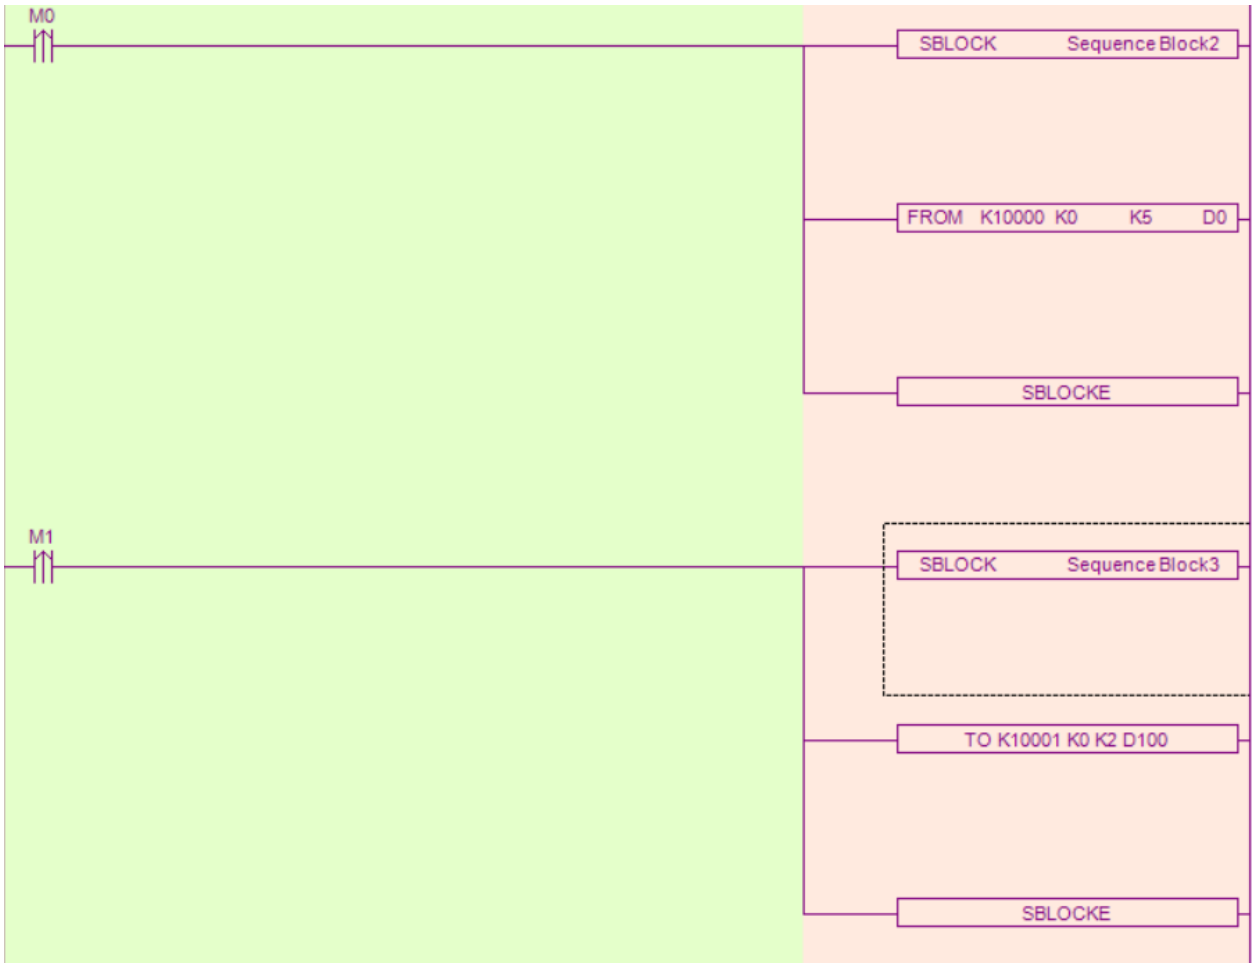
(e) Insert FROM/TO module



(f) Write instruction

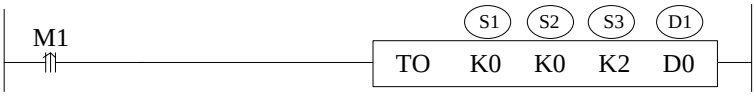


(g) Read instruction

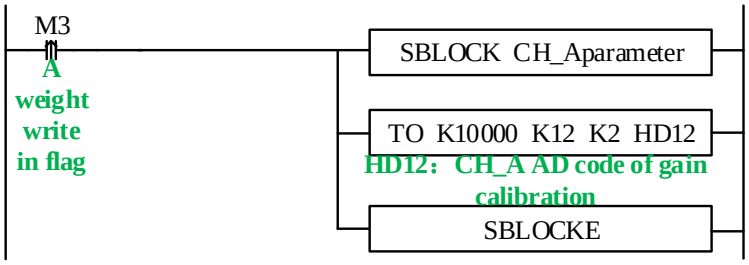


(h) Ladder chart

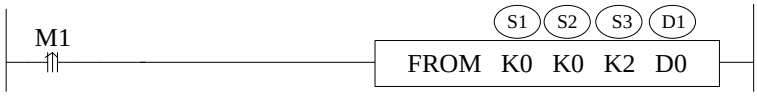
Write instruction TO



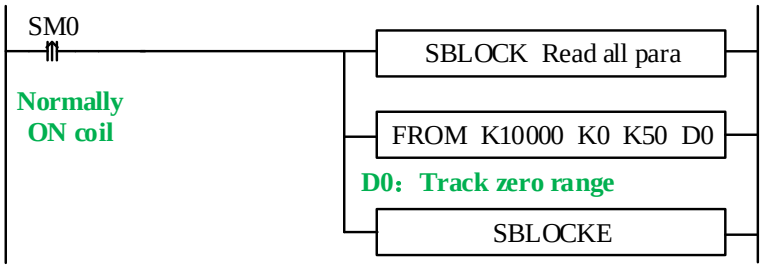
Function: write the PLC register data to module specified address, the unit is word.
Operand:
S1: target module number. Operand: K, TD, CD, D, HD, FD.
S2: module first address. Operand: K, TD, CD, D, HD, FD.
S3: write in register quantity. Operand: K, TD, CD, D, HD, FD.
D1: write in data register first address in PLC. Operand: TD, CD, D, HD, FD.
Example: write the weight value to module no.1 channel 1



Read instruction FROM



Function: read the module data to PLC register, the unit is word.
Operand:
S1: target module number. Operand: K, TD, CD, D, HD, FD.
S2: module first address. Operand: K, TD, CD, D, HD, FD.
S3: read register quantity. Operand: K, TD, CD, D, HD, FD.
D1: PLC register first address. Operand: TD, CD, D, HD, FD.
For example: read all the parameters of module no.1

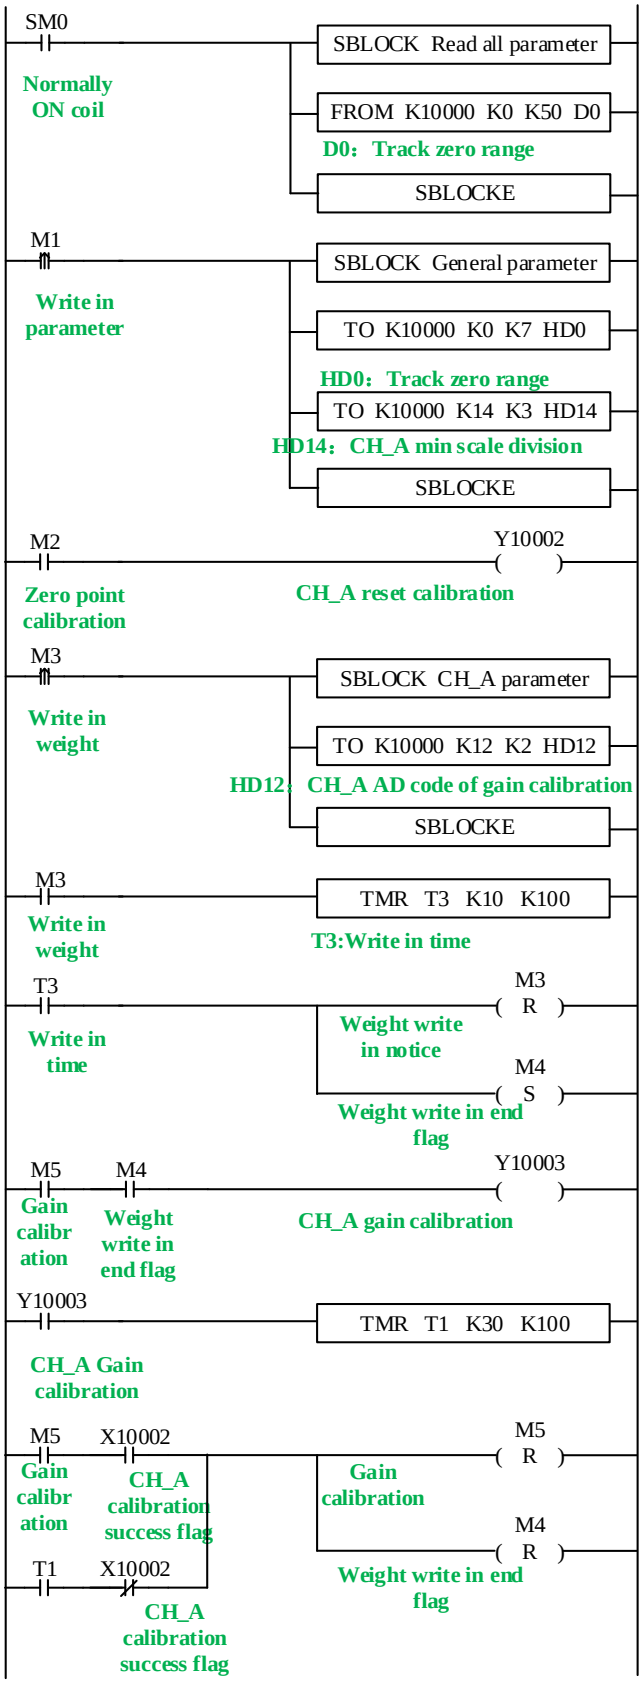


Note:

1. From/TO instruction can only be written in sequence function block, XD series PLC with firmware version less than v3.4.5 only allows up to 8 function blocks; XD/XL series PLC with firmware version v3.4.5 and above can write up to 100 blocks in the program, but can only run up to 8 blocks at the same time.
2. The starting number of module starts from k10000, k10000 is module 1 and k10001 is module 2. By analogy, module 16 is K10015.

13-11. Application program

Take module 1 as an example:



Explanation:

Read all the parameters and write in general parameters through FROM/TO instruction.

Set ON M1, write in all the parameters of channel 1.

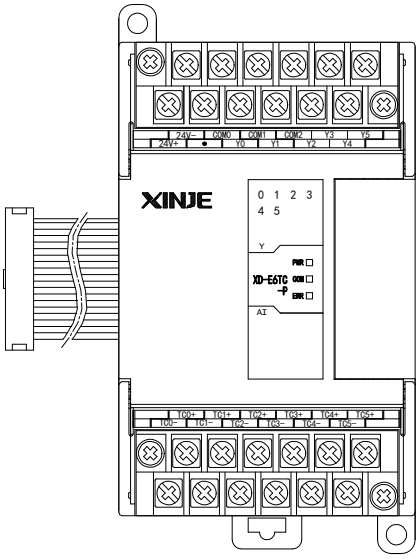
Zero-point calibration: set ON M2, if zero-point calibration is successful, X10002 is set ON.

Gain calibration: first set ON M3, write the weight value HD12 to the module. After write in success flag M4 is ON, it starts to calibrate gain. Set ON M5 to start the calibration, the preset stable time is 3s. after the scale is stable, gain calibration success flag X10002 is ON or calibration time T1 reached, reset M4, M5, gain calibration is finished.

14. Pt100 temperature control module XD-E6PT-P

14-1. Specification

This chapter mainly introduces XD-E6PT-P module specification, terminal description, input definition number assignment, working mode setting, external connection, A/D conversion diagram and related programming examples.



Features:

- Platinum thermal resistance input, Pt100
- 6 channels input, 6 channels output, 6 groups of PID parameters, auto-tune function
- 1mA constant current output, will not be affected by the exterior environment
- Resolution is 0.1℃
- As the special function module of XD3, 10 modules can be connected to the PLC. XD5/XDM/XDC/ XD5E/XDME can extend 16 modules. XD1/XD2 cannot extend modules.

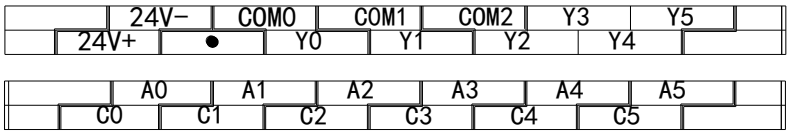
Specifications:

Item	Content
Analog input signal	Pt100 platinum thermal-resistance
Temperature measurement range	-100℃ ~ 500℃
Digital output bound	-1000~5000, 16 bits with sign bit, binary
Control precision	±0.5℃
Resolution	0.1℃
Integrate precision	±1%　(relative max value)
Conversion speed	80ms per channels
Analog power	DC24V±10%, 50mA
Installation format	Fixed with M3 screws or directly installed on orbit of DIN46277 (Width: 35mm)
Dimension	63mm×108mm×89.9mm

Note:

1. Without signal input, the channel data will be 5000
2. Connect to Pt100 platinum thermal resistance according to actual requirements

14-2. Terminals



Channel	Terminal name	Signal name
CH0	A0	0CH PT100 input
	C0	0CH common terminal of PT100 input
CH1	A1	1CH PT100 input
	C1	1CH common terminal of PT100 input
CH2	A2	2CH PT100 input
	C2	2CH common terminal of PT100 input
CH3	A3	3CH PT100 input
	C3	3CH common terminal of PT100 input
CH4	A4	4CH PT100 input
	C4	4CH common terminal of PT100 input
CH5	A5	5CH PT100 input
	C5	5CH common terminal of PT100 input
-	Y0	Channel 0 output
	Y1	Channel 1 output
	Y2	Channel 2 output

	Y3	Channel 3 output
	Y4	Channel 4 output
	Y5	Channel 5 output
	COM0	Common terminal of output
	COM1	Common terminal of output
	COM2	Common terminal of output
-	24V+	+24V power supply
	24V-	Common terminal of power supply

14-3. I/O address assignment

XD series analog modules don't occupy I/O units; the converted data is directly transferred into PLC register. The PLC registers are shown as the following:

Parameters	**Explanation**				
	Channel	Ch0	Ch1	……	Ch5
Display temperature Unit: 0.1 ℃	Module 1	ID10000	ID10001	ID1000×	ID10005
	Module 2	ID10100	ID10101	ID10X0×	ID10105
	……	ID10X00	ID10X01	ID10X0×	ID10X05
	Module 16	ID11500	ID11501	ID1150×	ID11505
PID output (return to the X input of PLC)	Module 1	X10000	X10001	X1000×	X10005
	Module 2	X10100	X10101	X1010×	X10105
	……	X10×00	X10×01	X10×0×	X10×05
	Module 16	X11700	X11701	X1170×	X11705
	When the duty cycle of the module is output, the X point should be monitored, not the Y point, because the Y point is the PID enable bit				
Connection state of PT100 (0 is connection, 1 is disconnection)	Module 1	X10010	X10011	X1001×	X10015
	Module 2	X10110	X10111	X1011×	X10115
	……	X10××0	X10××1	X10×××	X10××5
	Module 16	X11710	X11711	X1171×	X11715
Enable signal (0: OFF, 1: PID is ON)	Module 1	Y10000	Y10001	Y1000×	Y10005
	Module 2	Y10100	Y10101	Y1010×	Y10105
	……	Y1××00	Y1××01	Y1××0×	Y1××05
	Module 16	Y11700	Y11701	Y1170×	Y11705
	When "Y function selection" is set to "immediate output", Y10000 ~ Y10005 (for example, module 1) can be used to control Y0 ~ Y5 output on the module, that is, setting Y10000 will turn on Y0 output point, and so on; when "channel enable" is set, Y10000 (for example, module 1 CH1) must be set to on to normally use the PID control function of the module.				
PID auto-tune error signal bit (0	Module 1	X10020	X10021	X1002×	X10025
	Module 2	X10120	X10121	X1012×	X10125

is normal, 1 is error)	…..	X1××20	X1××21	X1××2×	X1××25
	Module 16	X11720	X11721	X1172×	X11725
PID control bit	Auto-tune triggered signal, start to auto-tune mode when set to 1 After auto-tune, PID parameters and temperature control period value are refreshed, the bit value is cleared to be 0. The user can read the bit to know the state. 1 means auto-tune is ongoing. 0 means auto-tune has finished.				
PID output (The result)	Digital quantity output range is 0~4095. When the PID output is analog quantity (such as steam valve open degree or silicon-controlled conduction angle), the value can be transmitted to the analog quantity output module in order to realize the control demand.				
PID parameters (P, I, D)	The best PID parameters got from the PID auto-tune. If the current PID parameters cannot meet the control requirements, users can set the experience PID parameters to make the module work according to the user setting value.				
PID calculation range (Diff) Unit: 0.1℃	PID arithmetic is effective in the range of T (setting temperature) ±Diff. In real temperature control environment, when the temperature is lower than T- Diff, the PID output is the maximum value; when the temperature is higher than T+Diff, the PID output is the minimum value.				
Temperature difference value δ Unit: 0.1℃	(sampling temperature value + temperature difference value δ) / 10 = display temperature. At the time the display temperature is the closest to the real temperature. This parameter is a sign value with the unit of 0.1℃, the value is retained when th power is cut off, the defaulted value is 0.				
Set temperature Unit: 0.1℃	The target temperature of the control system. Range from 0~1000℃, precision degree is 0.1℃.				
Temperature control period Unit: 0.1s	The temperature control period ranges from 0.5 to 200 seconds, the minimum precision is 0.1 second. The set value = real value × 10. For example: if the real temperature control period is 0.5 seconds, user should set 5 seconds in the module.				
Calibration environment temperature Unit: 0.1℃	If user realizes that the environment temperature is different from display temperature, they can write the correct environment temperature into the module. Then the module will calculate the temperature difference δ and save it. Temperature difference δ = adjusting environment temperature－sampling temperature. Unit: 0.1℃. For example, under the caloric balance condition, users measured the environment temperature is 60℃ with mercury thermometer, but the display temperature is 55℃ (sampling temperature is 550), temperature difference δ is 0. At this time, users can set the parameter to be 600, then the temperature difference δ is 50 (5 ℃). Display temperature = (550 + 50) / 10 = 60 ℃. **Attention: when setting the adjusting environment temperature, make sure it is the same as environment temperature. It is very important because the incorrect parameter will result in mistake of calculating temperature difference δ and affect the display temperature.				
auto-tune output range	The auto-tune output unit is percent. 100 means the duty ratio is 100% of the full-scale output, 80 means the duty ratio is 80% of the full-scale output.				

Note: when "Y function selection" is set to "immediate output", only channel display temperature value, temperature deviation value δ and calibration environment temperature value are valid in the above parameters, and other parameters do not work.

14-4. Working mode

There are two ways to set the working mode:

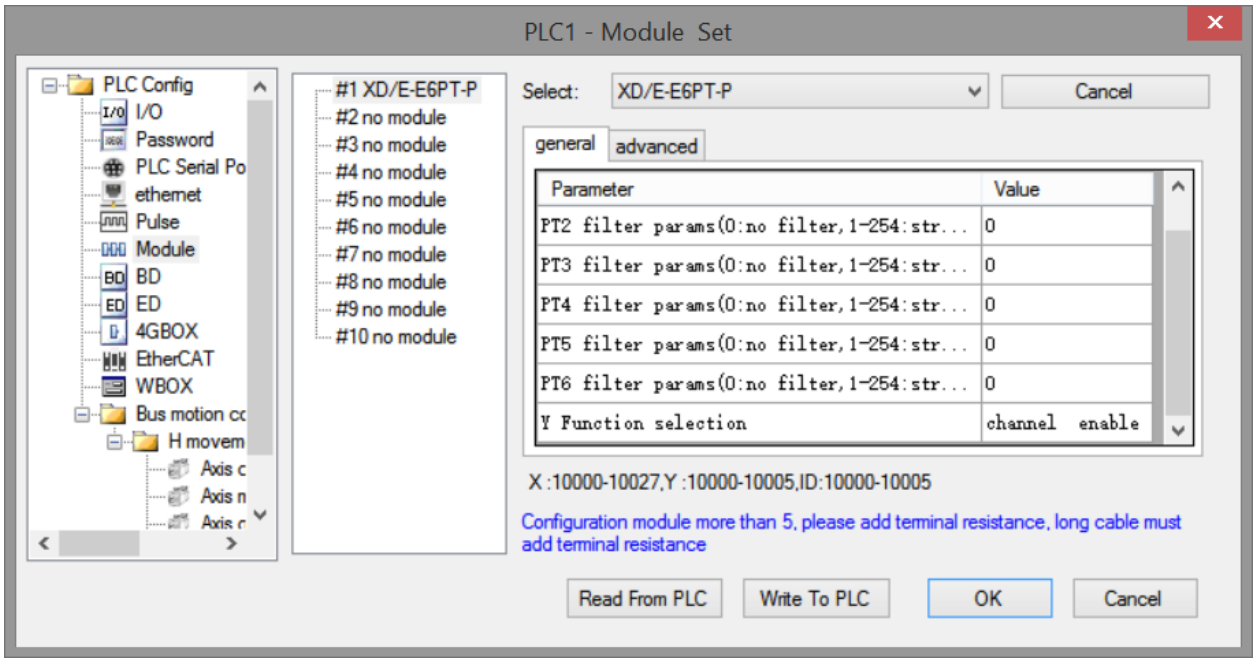
1. XDPpro software
2. Flash registers of PLC

XDPpro software:

Open the XDPpro software, click configure/expansion module settings:

Set the model and channel parameters in the following window. Then click write to PLC.

Please restart the PLC after setting.



Note:

1. the first-order low-pass filtering method uses this sampling value and the last filtering output value for weighting to obtain the effective filtering value.

2: the filter coefficient is set to 0 ~ 254 by the user, the smaller the value is, the more stable the data is, but it may cause data lag; when it is set to 1, the filtering effect is the strongest, and when it is set to 254, the filtering effect is the weakest, and the default value is 0 (no filtering).

3: "Y function selection" is only supported by modules with firmware version V100 and above.

4: "Y function selection" is used to specify the functions of Y10000 ~ Y10005 (take # 1 module as an example). The factory default is "channel enable", which supports the PID control function of the module itself. When it is set to "immediate output", the output points Y0 ~ Y5 on the module are ordinary digital output points, while the module only retains the temperature acquisition function. If you need temperature control, please use the PID command of PLC body.

Flash registers:

Set the filtering parameter through Flash registers of PLC.

Module no.	SFD address	Module no.	SFD address
#1	SFD350~SFD359	#9	SFD430~SFD439
#2	SFD360~SFD369	#10	SFD440~SFD449
#3	SFD370~SFD379	#11	SFD450~SFD459
#4	SFD380~SFD389	#12	SFD460~SFD469
#5	SFD390~SFD399	#13	SFD470~SFD479
#6	SFD400~SFD409	#14	SFD480~SFD489
#7	SFD410~SFD419	#15	SFD490~SFD499
#8	SFD420~SFD429	#16	SFD500~SFD509

Take module 1 as an example:

<table>
<tr><th colspan="2" rowspan="2">Register</th><th colspan="8">Bit7 Bit6 Bit5 Bit4 Bit3 Bit2 Bit1 Bit0</th><th rowspan="2">Note</th></tr>
<tr><td colspan="8"></td></tr>
<tr><td rowspan="2">SFD350</td><td>Byte0</td><td colspan="8">PT channel 1 filter parameter</td><td rowspan="12">AD filter parameter</td></tr>
<tr><td>Byte1</td><td colspan="8">PT channel 2 filter parameter</td></tr>
<tr><td rowspan="2">SFD351</td><td>Byte2</td><td colspan="8">PT channel 3 filter parameter</td></tr>
<tr><td>Byte3</td><td colspan="8">PT channel 4 filter parameter</td></tr>
<tr><td rowspan="2">SFD352</td><td>Byte4</td><td colspan="8">PT channel 5 filter parameter</td></tr>
<tr><td>Byte5</td><td colspan="8">PT channel 6 filter parameter</td></tr>
<tr><td rowspan="2">SFD353</td><td>Byte6</td><td colspan="8">-</td></tr>
<tr><td>Byte7</td><td colspan="8">-</td></tr>
<tr><td rowspan="2">SFD354</td><td>Byte8</td><td colspan="5">-</td><td colspan="3">Y function selection

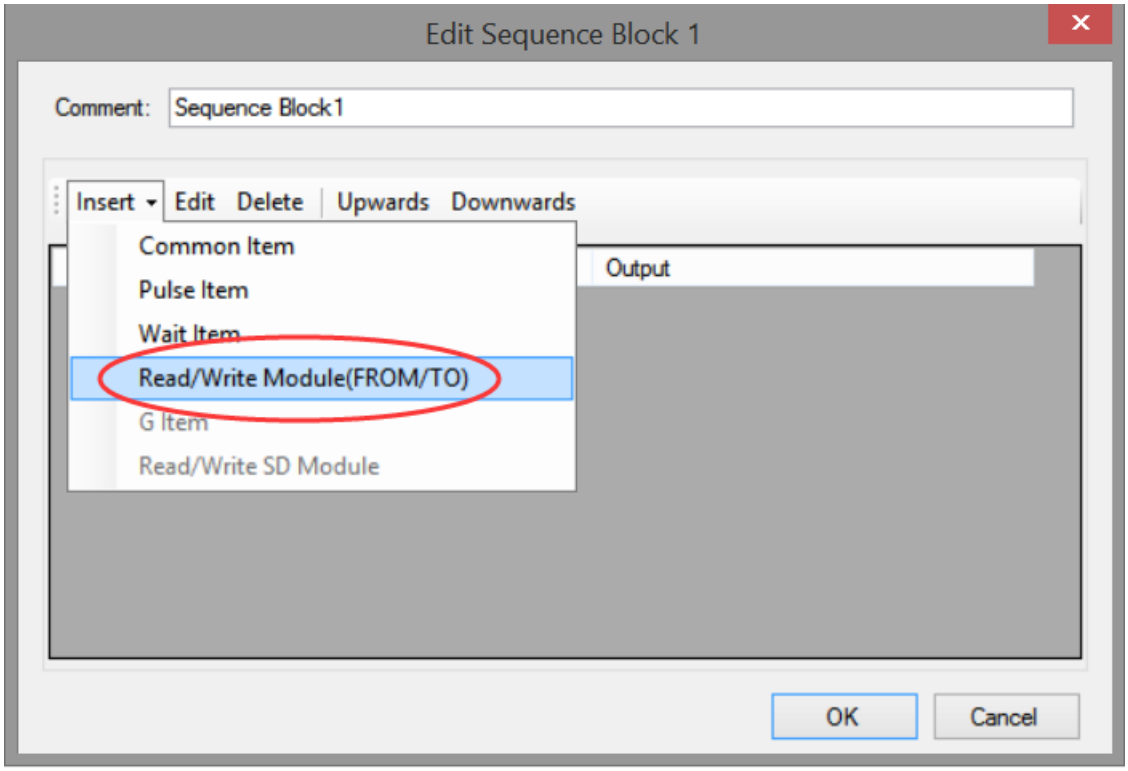
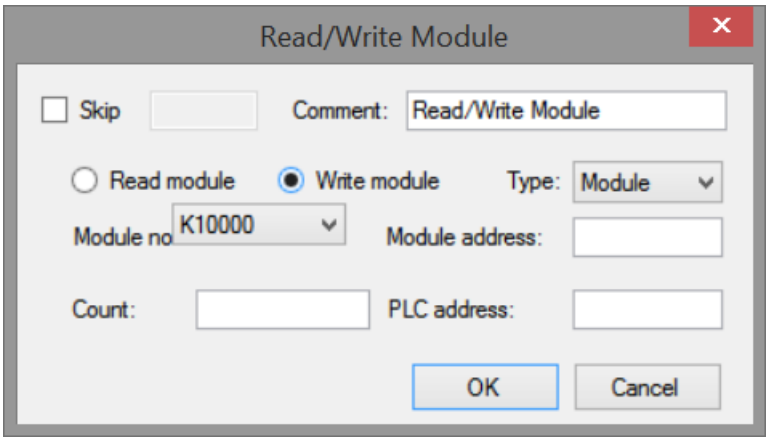
0001: immediate output</td></tr>
<tr><td>Byte9</td><td colspan="5">-</td><td colspan="3">-</td></tr>
<tr><td colspan="2">SFD355~SFD359</td><td colspan="8">-</td></tr>
</table>

14-5. FROM/TO instruction

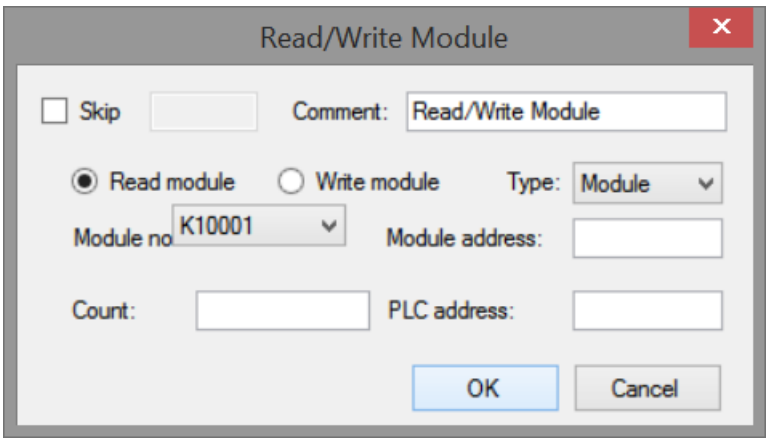
The reading and writing of XD-E6PT-P module needs to be completed through the FROM/TO instruction in the sequential function block, as shown in the figure below:



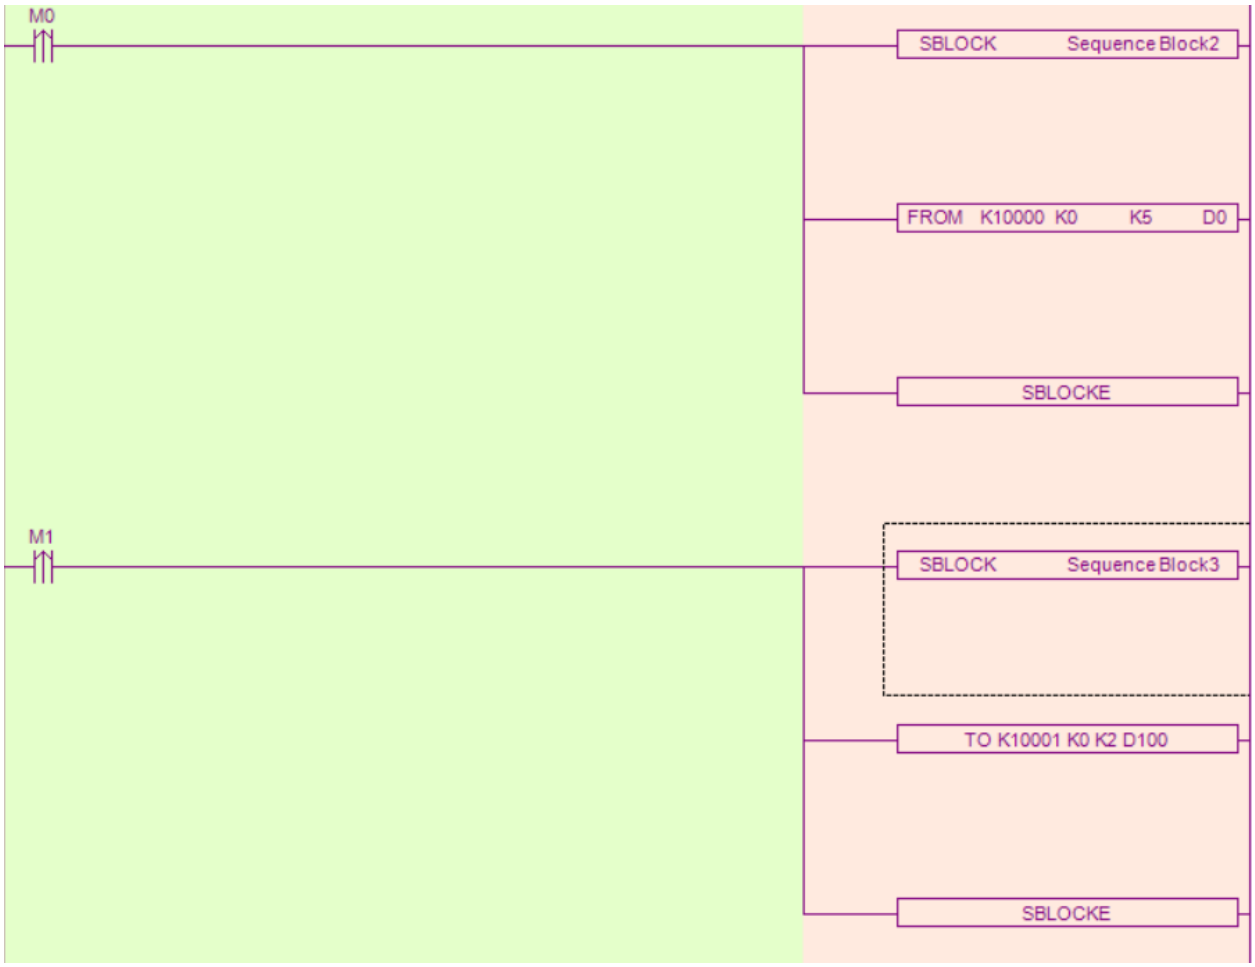
(a) Insert FROM/TO module



(b) Write instruction



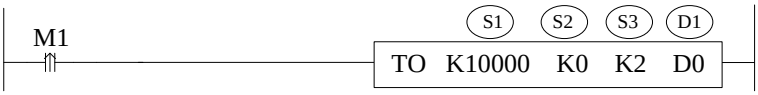
(c) Read instruction



(d) Ladder chart

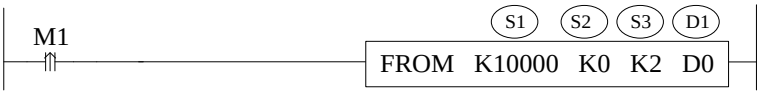
FROM and TO instructions

(1) Parameter write insruction TO



Function: write the PLC register data to module address, the operate unit is word.
Operand:
S1: target module number, range: 10000~10015. Operand: K, TD, CD, D, HD, FD
S2: first address of module. Operand: K, TD, CD, D, HD, FD
S3: write in register numbers. Operand: K, TD, CD, D, HD, FD
D1: first address of PLC. Operand: TD, CD, D, HD, FD

(2) Parameter read instruction FROM



Function: read the module data to the PLC regsiter, the operate unit is word.
S1: target module number, range: 10000~10015. Operand: K, TD, CD, D, HD, FD
S2: first address of module. Operand: K, TD, CD, D, HD, FD
S3: read register numbers. Operand: K, TD, CD, D, HD, FD
D1: first address of PLC. Operand: TD, CD, D, HD, FD

Note:
1: FROM/TO instruction can only be written in sequence function block, XD series PLC with firmware version less than v3.4.5 only allows up to 8 block function blocks; XD / XL series PLC with firmware version v3.4.5 and above can write up to 100 blocks in the program, but can only run up to 8 blocks at the same time.
2: The starting number of module starts from K10000, K10000 for # 1 module and k10001 for # 2 module. By analogy, # 16 module is K10015.
3: In v3.3 and below version software, the module number range is K0~K15. Please pay attention to the modification when transferring projects in different versions of software.

Related address definition:
The address of the read/write parameters:

From_To data		Default value	CH1	CH2	CH3	CH4	CH5	CH6	R/W
Auto-tune enable		0	K0	K0	K0	K0	K0	K0	RW
PID output		-	K1	K2	K3	K4	K5	K6	R
Setting		0	K7	K8	K9	K10	K11	K12	RW
PID	Kp	40	K13	K17	K21	K25	K29	K33	RW
	Ki	240	K14	K18	K22	K26	K30	K34	RW
	Kd	60	K15	K19	K23	K27	K31	K35	RW

Temperature control period (unit: 0.1s)		20	K37	K38	K39	K40	K41	K42	RW
Output range (0~100)		100	K43	K44	K45	K46	K47	K48	RW
Temperature deviation calibration		0	K49	K50	K51	K52	K53	K54	RW
Present actual temperature, can be used to calibrate		-	K55	K56	K57	K58	K59	K60	W

FROM/TO data initialization	-	K61	K61	K61	K61	K61	K61	W

Note: the "from / to data initialization" function requires the firmware version of the module to be V100 or above. This function can restore the parameters in the above table to the factory settings. When using it, you need to set K61 to 1, and set to other values are invalid.

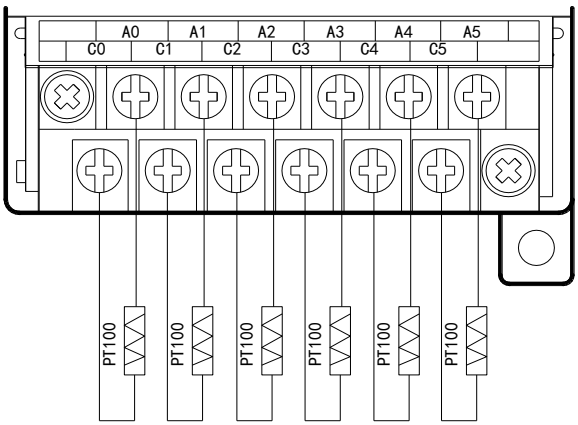
The module can automatically save the set temperature value, PID parameters, temperature control cycle, output range, temperature deviation and temperature calibration parameters. When writing the above parameters, the rising edge should be used to trigger the writing. It is recommended to write only the parameters used. It is not recommended to write the whole piece of data for the convenience of programming, because writing 0 to some addresses will cause the system to fail to work.

14-6. Exterior connection

About the external wiring, please see the following items:

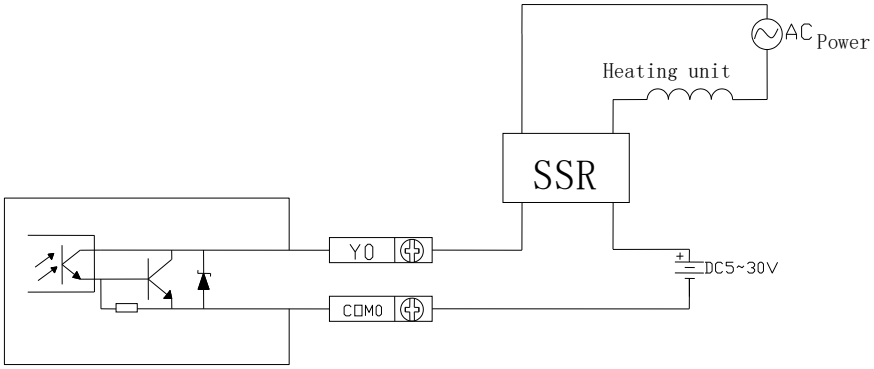
- When connect ＋24V power, please use 24V power on PLC main unit to avoid interference.
- To avoid interference, please use shield cable to ground.

Input connection:

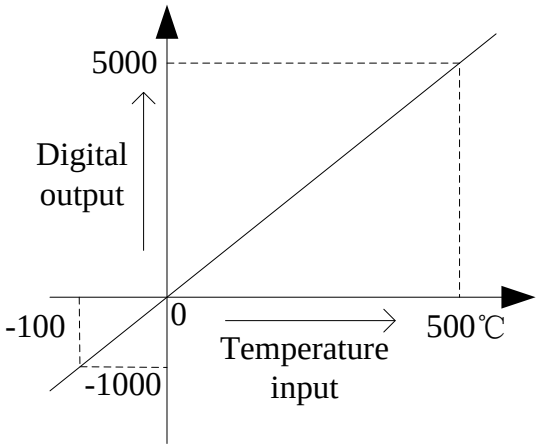


Output connection:

- Output terminals: transistor output terminal please choose DC 5V~30V power supply.
- Circuit insulation
  PLC interior circuit and output transistor is optical insulation. Each public module is also separated.
- Response time
  The time is less than 0.2ms from PLC driving (or cut) optical coupling device to transistor ON/OFF.
- Output current
  Each point current is 50mA to avoid over-heat.
- Open circuit leakage current
  Below 0.1mA

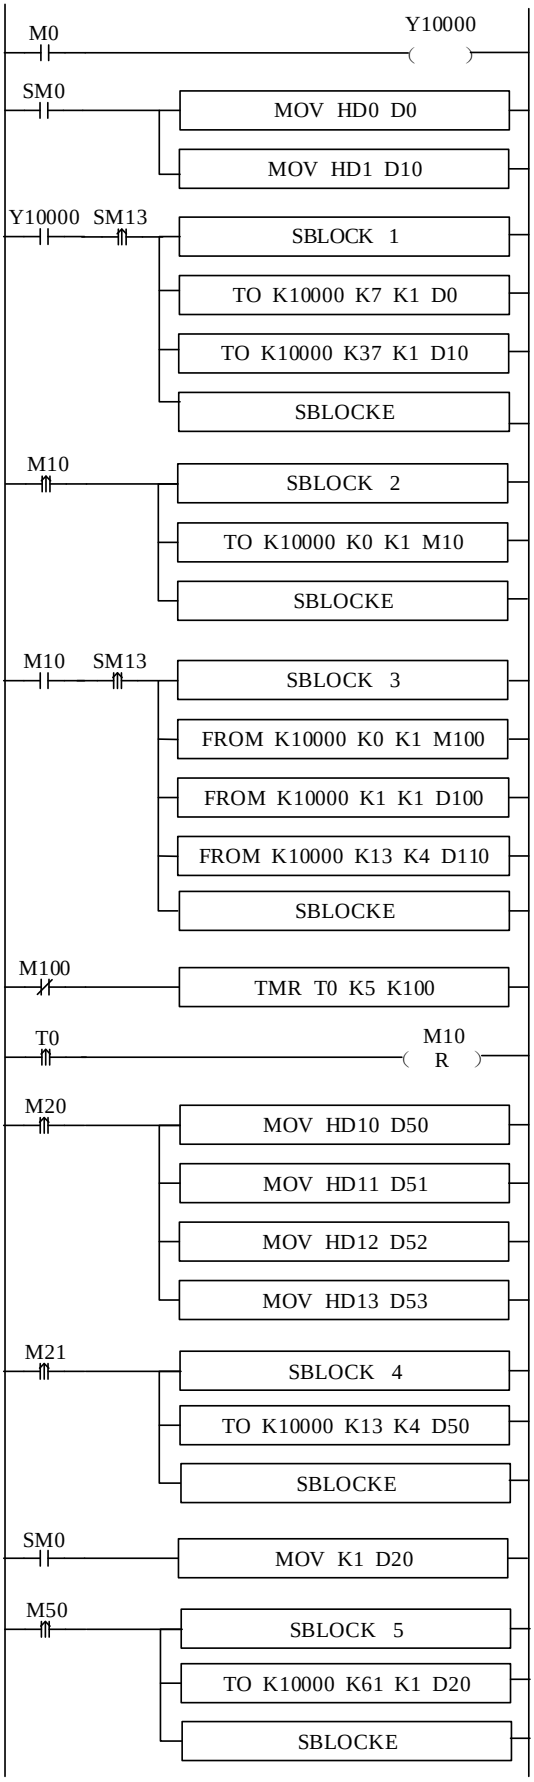


PT100 input features:



14-7. Programming

Example 1: Module 1, PID control for CH0



// set ON the PID enable bit

// set the target value (unit: 0.1℃)

// set temperature control cycle (unit: 0.1s)

//write in the target value, temperature control period

// write in auto-tune bit

// read auto-tune bit and PID parameters

// read auto-tune bit

// read PID output value

// read P, I, D, DIFF parameters

//after auto-tune bit reset for 0.5s, reset auto-tune flag bit

//set P value

//set I value

//set D value

//set Diff value

//manually PID control, write in PID parameters

//initialize the module parameters

Explanation:

(1) When the auto-tuning enable is turned on, the command will immediately occupy 8 bits of M10-M17 in total. M10-M15 corresponds to the auto-tuning enable of each channel. M16 and M17 have no meaning and need to be left blank.

(2) If the output is a solid state relay, the temperature control cycle is recommended to be 1 ~ 3s; if the output is a relay, the temperature control cycle is recommended to be 3 ~ 15s.

(3) Due to the inconsistency of units, the parameters of PLC main body PID and module PID cannot be used in common. The PID parameters of the PLC are in upper case and the PID parameters of the module are in lower case. The specific conversion relations are as follows: p= P/100; i=I/10; d=D/100.

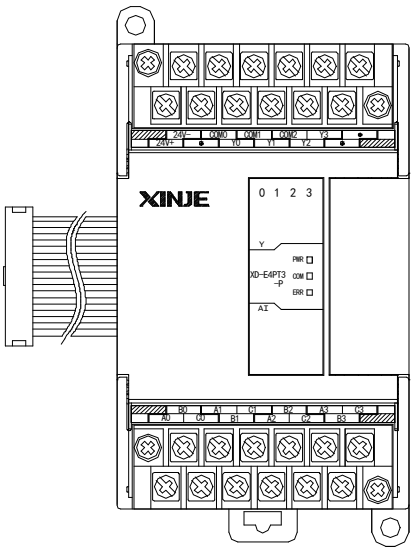
Soft component functions:

M0	Set ON the PID enable
SM0	Set the target value, temperature control bit
M10	Write in auto-tune bit
M20	Set manually PID parameters
M21	Write-in manually PID parameters
M10	Read auto-tune bit, PID parameters, PID output
M50	Initialize the module
Y10000	PID enable bit of channel 0
D0	Set the target value
D10	Temperature control period
D50	P
D51	I
D52	D
D53	DIFF

15. Pt100 temperature control module XD-E4PT3-P

15-1. Specification

This chapter mainly introduces XD-E4PT3-P module specification, terminal description, input definition number assignment, working mode setting, external connection, A/D conversion diagram and related programming examples.



Features:

- Platinum thermal resistance input, Pt100
- 4 channels input, 4 channels output, 4 groups of PID parameters, auto-tune function
- 1mA constant current output, will not be affected by the exterior environment
- Resolution is 0.1℃
- As the special function module of XD3, 10 modules can be connected to the PLC. XD5/XDM/XDC/ XD5E/XDME can extend 16 modules. XD1/XD2 cannot extend modules.

Specifications:

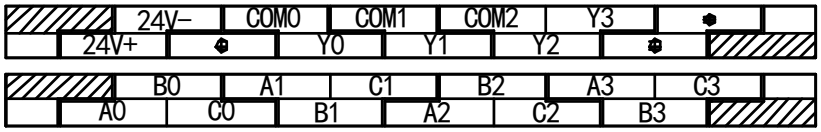
Item	Content
Analog input signal	Pt100 platinum thermal-resistance
Temperature measurement range	-100℃ ~ 500℃
Digital output bound	-1000~5000, 16 bits with sign bit, binary
Control precision	±0.5℃
Resolution	0.1℃
Integrate precision	±1%　(relative max value)
Conversion speed	450ms every 4 channels

Analog power	DC24V ±10%, 50mA
Installation format	Fixed with M3 screws or directly installed on orbit of DIN46277 (Width: 35mm)
Dimension	63mm×108mm×89.9mm

Note:

1. Without signal input, the channel data will be 5000
2. Connect to Pt100 platinum thermal resistance according to actual requirements

15-2. Terminals



CH	Terminal	Function
-	24V+	+24V power supply input
	24V-	Common terminal of power supply
CH0	A0	CH0 temperature input
	B0	CH0 input common terminal
	C0	CH0 input common terminal
CH1	A1	CH1 temperature input
	B1	CH1 input common terminal
	C1	CH1 input common terminal
CH2	A2	CH2 temperature input
	B2	CH2 input common terminal
	C2	CH2 input common terminal
CH3	A3	CH3 temperature input
	B3	CH3 input common terminal
	C3	CH3 input common terminal
-	Y0~Y3	Digital output terminal of CH0~CH3
-	COM0~COM2	Output common terminal (Y0 corresponds to COM0, Y1 corresponds to COM1, Y2~Y3 correspond to COM2)

15-3. I/O address assignment

XD series analog modules don't occupy I/O units; the converted data is directly transferred into PLC register. The PLC registers are shown as the following:

Parameters	Explanation				
	Channel	CH0	CH1	CH2	CH3
Display temperature Unit: 0.1 ℃	Module 1	ID10000	ID10001	ID10002	ID10003
	Module 2	ID10100	ID10101	ID10102	ID10103
	……	ID10x00	ID10x01	ID10x02	ID10x03
	Module 16	ID11500	ID11501	ID11502	ID11503
PID output (return to the X input of PLC)	Module 1	X10000	X10001	X10002	X10003
	Module 2	X10100	X10101	X10102	X10103
	……	X10x00	X10x01	X10x02	X10x03
	Module 16	X11700	X11701	X11702	X11703
	When the duty cycle of the module is output, the X point should be monitored, not the Y point, because the Y point is the PID enable bit				
Connection state of PT100 (0 is connection, 1 is disconnection)	Module 1	X10010	X10011	X10012	X10013
	Module 2	X10110	X10111	X10112	X10113
	……	X10x10	X10x11	X10x12	X10x13
	Module 16	X11710	X11711	X11712	X11713
Enable signal (0: OFF, 1: PID is ON)	Module 1	Y10000	Y10001	Y10002	Y10003
	Module 2	Y10100	Y10101	Y10102	Y10103
	……	Y10x00	Y10x01	Y10x02	Y10x03
	Module 16	Y11700	Y11701	Y11702	Y11703
	When "Y function selection" is set to "immediate output", Y10000 ~ Y10003 (for example, module 1) can be used to control Y0 ~ Y3 output on the module, that is, setting Y10000 will turn on Y0 output point, and so on; when "channel enable" is set, Y10000 (for example, module 1 CH1) must be set to on to normally use the PID control function of the module.				
PID auto-tune error signal bit (0 is normal, 1 is error)	Module 1	X10020	X10021	X10022	X10023
	Module 2	X10120	X10121	X10122	X10123
	…..	X10x20	X10x21	X10x22	X10x23
	Module 16	X11720	X11721	X11722	X11723
PID control bit	Auto-tune triggered signal, start to auto-tune mode when set to 1 After auto-tune, PID parameters and temperature control period value are refreshed, the bit value is cleared to be 0. The user can read the bit to know the state. 1 means auto-tune is ongoing. 0 means auto-tune has finished.				
PID output (digital quantity)	Digital quantity output range is 0~4095.				
PID parameters (P, I, D)	The best PID parameters got from the PID auto-tune. If the current PID parameters cannot meet the control requirements, users can set the experience PID parameters to make the module work according to the user setting value.				
PID calculation range (Diff) Unit: 0.1℃	PID arithmetic is effective in the range of T (setting temperature) ±Diff. In real temperature control environment, when the temperature is lower than T- Diff, the PID output is the maximum value; when the temperature is higher than T+Diff, the PID output is the minimum value.				
Temperature difference value δ	(sampling temperature value + temperature difference value δ) / 10 = display temperature. At the time the display temperature is the closest to the real temperature. This parameter is a sign value				

Unit: 0.1℃	with the unit of 0.1℃, the value is retained when th power is cut off, the defaulted value is 0.
Set temperature Unit: 0.1℃	The target temperature of the control system. Range from 0~1000℃, precision degree is 0.1℃.
Temperature control period Unit: 0.1s	The temperature control period ranges from 0.5 to 200 seconds, the minimum precision is 0.1 second. The set value = real value × 10. For example: if the real temperature control period is 0.5 seconds, user should set 5 seconds in the module.
Calibration environment temperature Unit: 0.1℃	If user realizes that the environment temperature is different from display temperature, they can write the correct environment temperature into the module. Then the module will calculate the temperature difference δ and save it. Temperature difference δ = adjusting environment temperature－sampling temperature. Unit: 0.1℃. For example, under the caloric balance condition, users measured the environment temperature is 60℃ with mercury thermometer, but the display temperature is 55℃ (sampling temperature is 550), temperature difference δ is 0. At this time, users can set the parameter to be 600, then the temperature difference δ is 50 (5 ℃). Display temperature = (550 + 50) / 10 = 60 ℃. **Attention: when setting the adjusting environment temperature, make sure it is the same as environment temperature. It is very important because the incorrect parameter will result in mistake of calculating temperature difference δ and affect the display temperature.
auto-tune output range	The auto-tune output unit is percent. 100 means the duty ratio is 100% of the full-scale output, 80 means the duty ratio is 80% of the full-scale output.

Note: when "Y function selection" is set to "immediate output", only channel display temperature value, temperature deviation value δ and calibration environment temperature value are valid in the above parameters, and other parameters do not work.

15-4. Working mode

There are two ways to set the working mode:

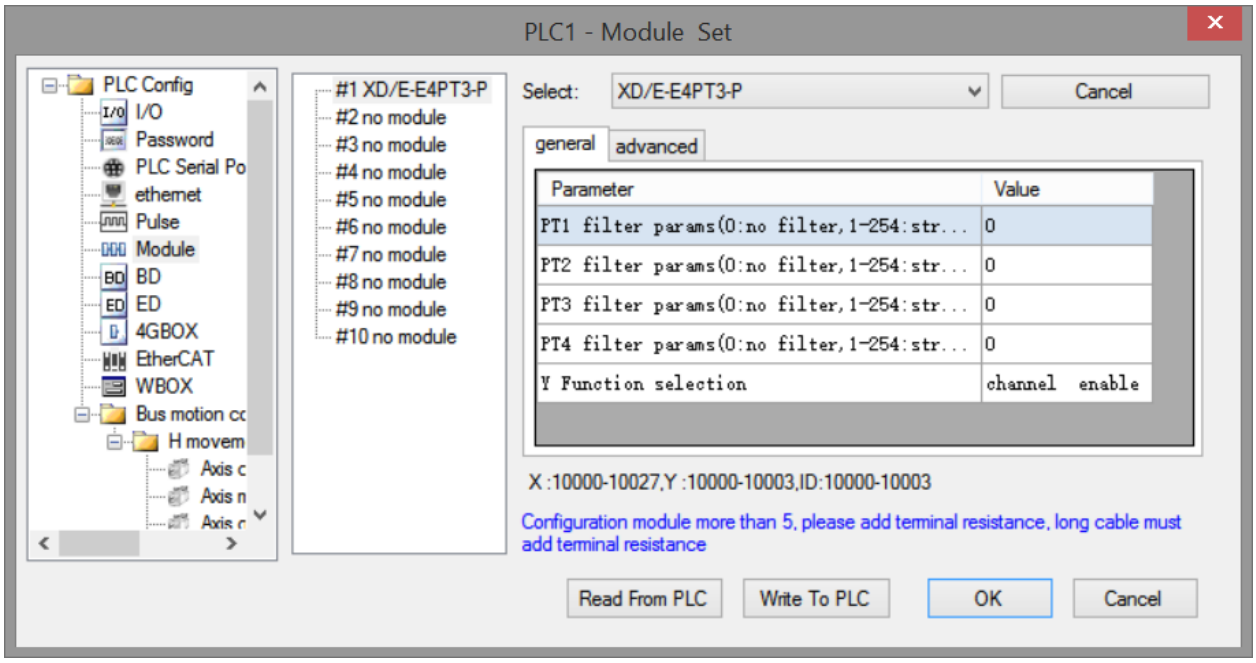
1. XDPpro software
2. Flash registers of PLC

XDPpro software:

Open the XDPpro software, click configure/expansion module settings:

Set the model and channel parameters in the following window. Then click write to PLC.

Please restart the PLC after setting.



Note:

1. the first-order low-pass filtering method uses this sampling value and the last filtering output value for weighting to obtain the effective filtering value.

2: the filter coefficient is set to 0 ~ 254 by the user, the smaller the value is, the more stable the data is, but it may cause data lag; when it is set to 1, the filtering effect is the strongest, and when it is set to 254, the filtering effect is the weakest, and the default value is 0 (no filtering).

3: "Y function selection" is only supported by modules with firmware version V100 and above.

4: "Y function selection" is used to specify the functions of Y10000 ~ Y10003 (take # 1 module as an example). The factory default is "channel enable", which supports the PID control function of the module itself. When it is set to "immediate output", the output points Y0 ~ Y3 on the module are ordinary digital output points, while the module only retains the temperature acquisition function. If you need temperature control, please use the PID command of PLC body.

Flash registers:

Set the filtering parameter through Flash registers of PLC.

Module no.	SFD address	Module no.	SFD address
#1	SFD350~SFD359	#9	SFD430~SFD439
#2	SFD360~SFD369	#10	SFD440~SFD449
#3	SFD370~SFD379	#11	SFD450~SFD459
#4	SFD380~SFD389	#12	SFD460~SFD469

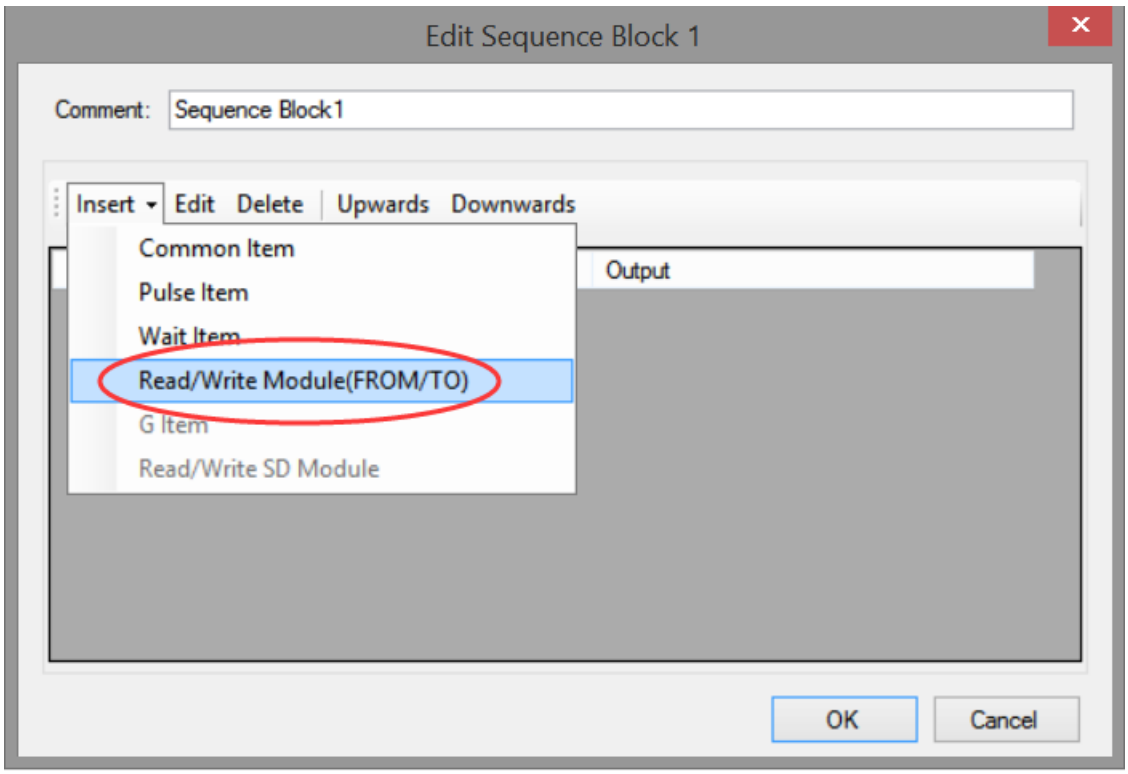
#5	SFD390~SFD399	#13	SFD470~SFD479
#6	SFD400~SFD409	#14	SFD480~SFD489
#7	SFD410~SFD419	#15	SFD490~SFD499
#8	SFD420~SFD429	#16	SFD500~SFD509

Take module 1 as an example:

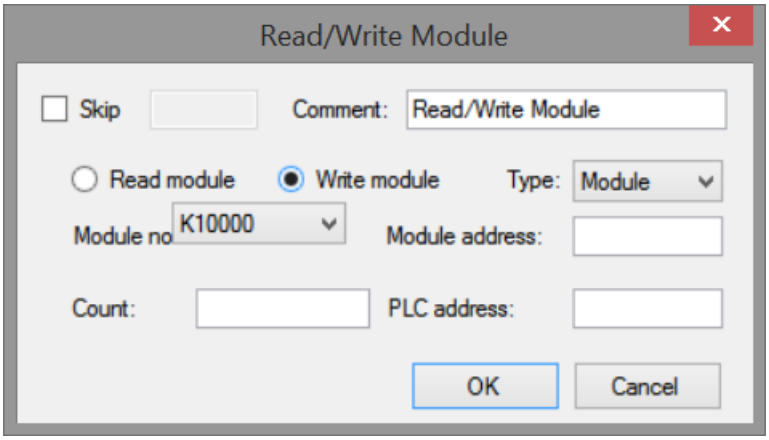
Register		Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	Note
SFD350	Byte0	PT channel 1 filter parameter								AD filter parameter
	Byte1	PT channel 2 filter parameter								
SFD351	Byte2	PT channel 3 filter parameter								
	Byte3	PT channel 4 filter parameter								
SFD352	Byte4	-								
	Byte5	-								
SFD354	Byte8	-				Y function selection 0000: channel enable 0001: immediate output				
	Byte9	-				-				
SFD355~SFD359		-								

15-5. FROM/TO instruction

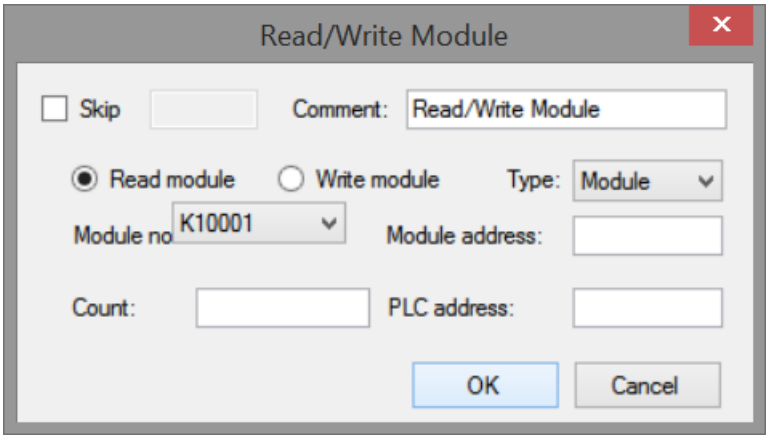
The reading and writing of XD-E4PT3-P module needs to be completed through the FROM/TO instruction in the sequential function block, as shown in the figure below:



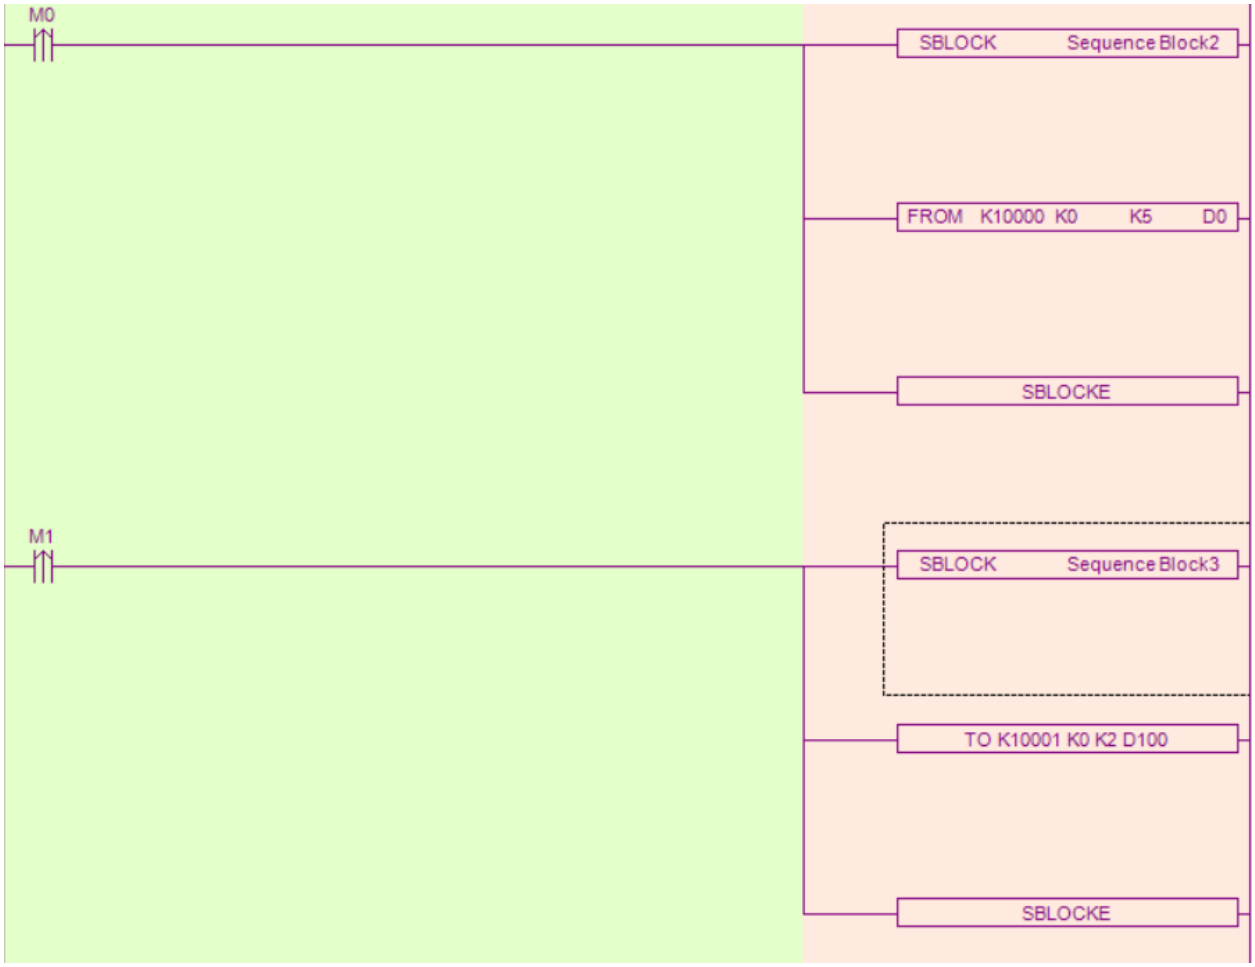
3. Insert FROM/TO module



4. Write instruction



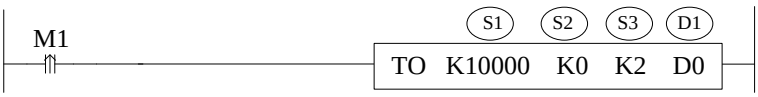
5. Read instruction



6. Ladder chart

FROM and TO instructions

(3) Parameter write insruction TO



Function: write the PLC register data to module address, the operate unit is word.

Operand:

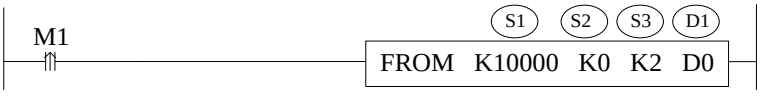
S1: target module number, range: 10000~10015. Operand: K, TD, CD, D, HD, FD

S2: first address of module. Operand: K, TD, CD, D, HD, FD

S3: write in register numbers. Operand: K, TD, CD, D, HD, FD

D1: first address of PLC. Operand: TD, CD, D, HD, FD

(4) Parameter read instruction FROM



Function: read the module data to the PLC regsiter, the operate unit is word.

S1: target module number, range: 10000~10015. Operand: K, TD, CD, D, HD, FD
S2: first address of module. Operand: K, TD, CD, D, HD, FD
S3: read register numbers. Operand: K, TD, CD, D, HD, FD
D1: first address of PLC. Operand: TD, CD, D, HD, FD

Note:
1: FROM/TO instruction can only be written in sequence function block, XD series PLC with firmware version less than v3.4.5 only allows up to 8 block function blocks; XD / XL series PLC with firmware version v3.4.5 and above can write up to 100 blocks in the program, but can only run up to 8 blocks at the same time.
2: The starting number of module starts from K10000, K10000 for # 1 module and k10001 for # 2 module. By analogy, # 16 module is K10015.
3: In v3.3 and below version software, the module number range is K0~K15. Please pay attention to the modification when transferring projects in different versions of software.

Related address definition:
The address of the read/write parameters:

From_To data		Default value	CH1	CH2	CH3	CH4	R/W
Auto-tune enable		0	K0	K0	K0	K0	RW
PID output		-	K1	K2	K3	K4	R
Setting		0	K5	K6	K7	K8	RW
PID	Kp	K9	K13	K17	K21	K25	RW
	Ki	K10	K14	K18	K22	K26	RW
	Kd	K11	K15	K19	K23	K27	RW
	Diff	K12	K16	K20	K24	K28	RW
Temperature control period (unit: 0.1s)		20	K25	K26	K27	K28	RW
Output range (0~100)		100	K29	K30	K31	K32	RW
Temperature deviation calibration		0	K33	K34	K35	K36	RW
Present actual temperature, can be used to calibrate		-	K37	K38	K39	K40	W
FROM/TO data initialization		-	K41	K41	K41	K41	W

Note: the "from / to data initialization" function requires the firmware version of the module to be V100 or above. This function can restore the parameters in the above table to the factory settings. When using it, you need to set K41 to 1, and set to other values are invalid.

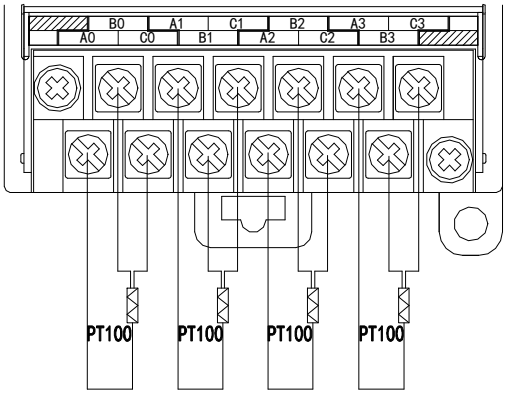
The module can automatically save the set temperature value, PID parameters, temperature control cycle, output range, temperature deviation and temperature calibration parameters. When writing the above parameters, the rising edge should be used to trigger the writing. It is recommended to write only the parameters used. It is not recommended to write the whole piece of data for the convenience of programming, because writing 0 to some addresses will cause the system to fail to work.

15-6. Exterior connection

About the external wiring, please see the following items:

- When connect ＋24V power, please use 24V power on PLC main unit to avoid interference.
- To avoid interference, please use shield cable to ground.

Input connection:



Output connection:

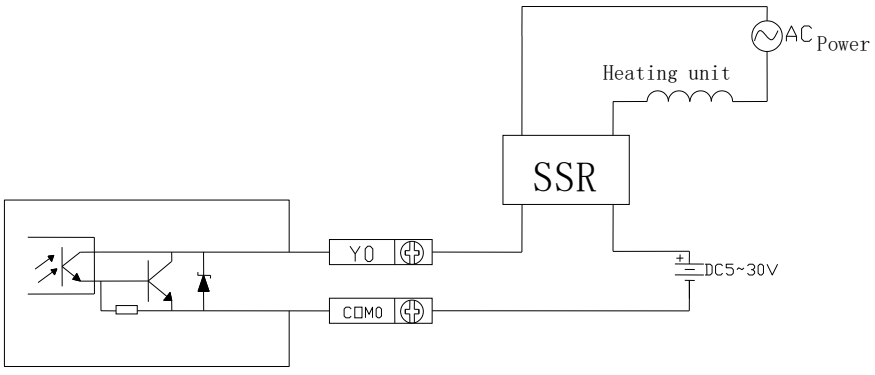
- Output terminals: transistor output terminal please choose DC 5V~30V power supply.
- Circuit insulation

  PLC interior circuit and output transistor is optical insulation. Each public module is also separated.
- Response time

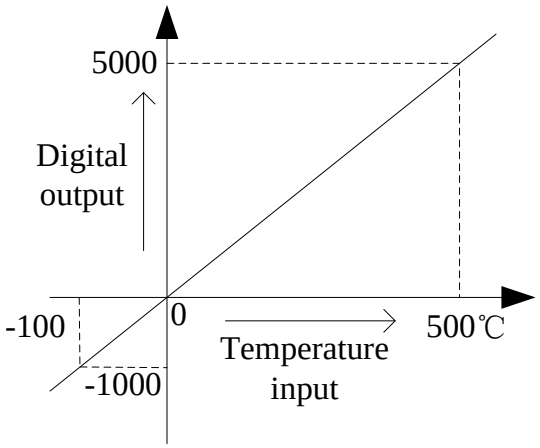
  The time is less than 0.2ms from PLC driving (or cut) optical coupling device to transistor ON/OFF.
- Output current

  Each point current is 50mA to avoid over-heat.
- Open circuit leakage current

  Below 0.1mA

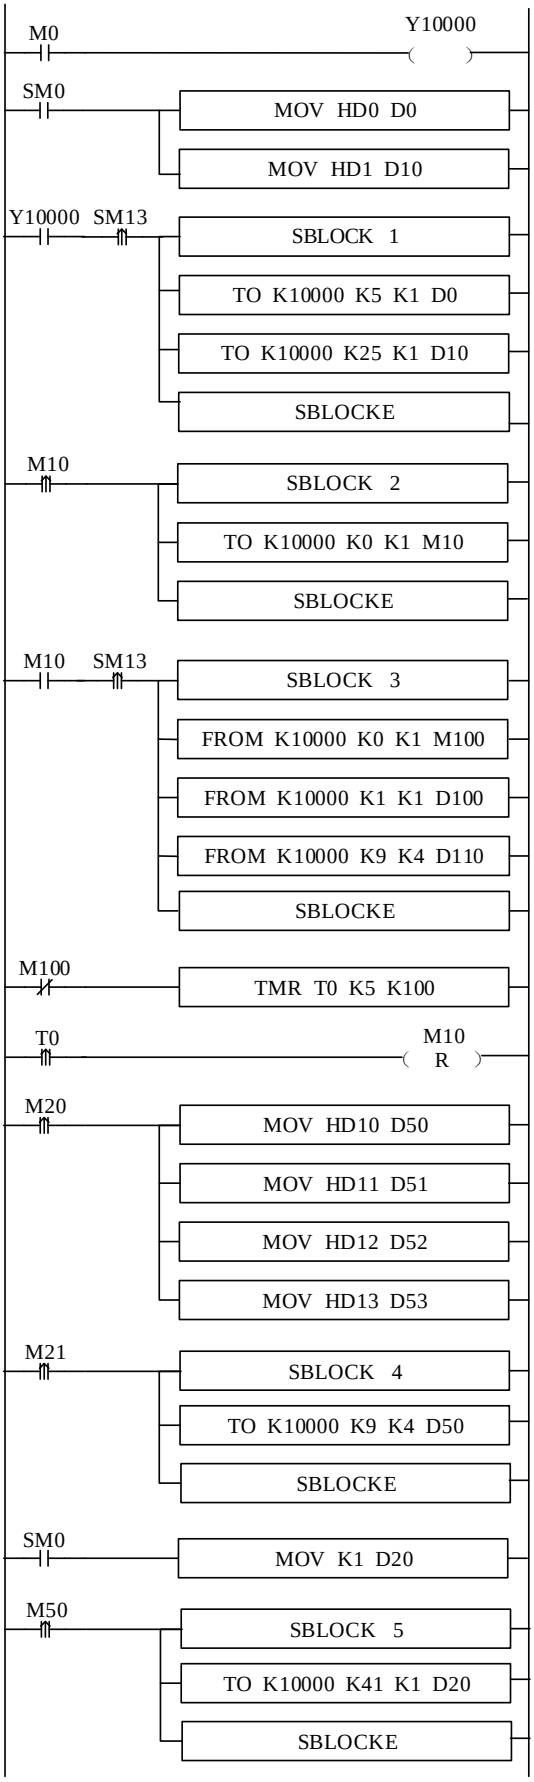


PT100 input features:



15-7. Programming

Example 1: Module 1, PID control for CH0



// set ON the PID enable bit

// set the target value (unit: 0.1℃)

// set temperature control cycle (unit: 0.1s)

//write in the target value, temperature control period

// write in auto-tune bit

// read auto-tune bit and PID parameters

// read auto-tune bit

// read PID output value

// read P, I, D, DIFF parameters

//after auto-tune bit reset for 0.5s, reset auto-tune flag bit

//set P value

//set I value

//set D value

//set Diff value

//manually PID control, write in PID parameters

//initialize the module parameters

Explanation:

(1) When the auto-tuning enable is turned on, the command will immediately occupy 8 bits of M10-M17 in total. M10-M13 corresponds to the auto-tuning enable of each channel. M14 and M17 have no meaning and need to be left blank.

(2) If the output is a solid state relay, the temperature control cycle is recommended to be 1 ~ 3s; if the output is a relay, the temperature control cycle is recommended to be 3 ~ 15s.

(3) Due to the inconsistency of units, the parameters of PLC main body PID and module PID cannot be used in common. The PID parameters of the PLC are in upper case and the PID parameters of the module are in lower case. The specific conversion relations are as follows: p= P/100; i=I/10; d=D/100.

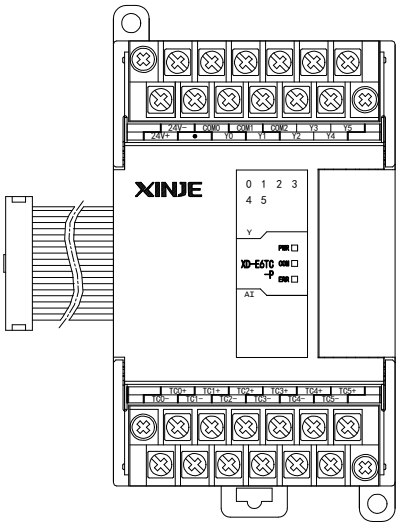
Soft component functions:

M0	Set ON the PID enable
SM0	Set the target value, temperature control bit
M1	Write in auto-tune bit
M3	Set manually PID parameters
M4	Write-in manually PID parameters
M10	Read auto-tune bit, PID parameters, PID output
M50	Initialize the module
Y10000	PID enable bit of channel 0
D0	Set the target value
D10	Temperature control period
D80	P
D81	I
D82	D
D83	DIFF

16. Thermocouple temperature control module XD-E6TC-P, XD-E2TC-P

16-1. Specification

This chapter mainly introduces the specification, thermocouple knowledge, terminal description, data address description, workflow and principle of XD-E6TC-P, XD-E2TC-P modules, as well as the instructions for reading and writing data and related programming examples.



Features:

- Thermocouple sensor signal input
- XD-E6TC-P: 6 channels input, 6 channels output, 6 groups of PID parameters, support auto-tune function
- XD-E2TC-P: 2 channels input, 2 channels output, 2 groups of PID parameters, support auto-tune function
- Built-in cold-terminal compensation circuit
- Resolution is 0.1℃
- As the special function module of XD3, 10 modules can be connected to the PLC. XD5/XDM/XDC/ XD5E/XDME can extend 16 modules. XD1/XD2 cannot extend modules.

Specifications:

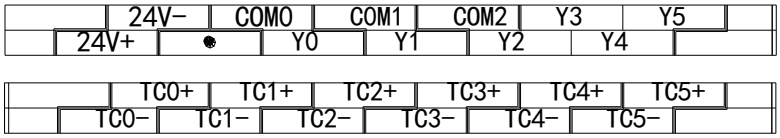
Item	Contents	
Analog signal input	Thermocouple K, S, E, N, B, T, J, R	
Temperature measurement range	K	0℃～1300℃
	S	0℃～1700℃
	E	0℃～600℃
	N	0℃～1200℃
	B	0℃～1800℃ (shows 0 below 250℃)
	T	0℃～400℃
	J	0℃～800℃
	R	0℃～1700℃

Item	Contents
Digital output range	0~max temperature measurement value×10 (take type K as an example, the digital output range is 0~13000) 16-bit with signed bit, binary
Control precision	±0.5℃
Resolution	0.1℃
Integrate precision	±1% (relative max value)
Conversion speed	80ms per channel
Power supply	DC24V±10%, 50mA
Installation mode	Fixed with M3 screws or directly installed on orbit of DIN46277 (Width: 35mm)
Dimension	63mm×108mm×89.9mm

Note:

1. If no signal input, the channel data is 0.
2. According to the actual requirement to connect the thermocouple.
3. The cover of device which installs thermocouple should be connected to the ground.

16-2. Terminals



Channel	Terminal name	Signal name
CH0	TC0+	0CH thermocouple input +
	TC0-	0CH thermocouple input -
CH1	TC1+	1CH thermocouple input +
	TC1-	1CH thermocouple input -
CH2	TC2+	2CH thermocouple input +
	TC2-	2CH thermocouple input -
CH3	TC3+	3CH thermocouple input +
	TC3-	3CH thermocouple input -
CH4	TC4+	4CH thermocouple input +
	TC4-	4CH thermocouple input -
CH5	TC5+	5CH thermocouple input +
	TC5-	5CH thermocouple input -
CH0	Y0	0CH output
	COM0	0CH common terminal of output
CH1	Y1	1CH output
	COM1	1CH common terminal of output
CH2	Y2	2CH output

	COM2	2CH common terminal of output
CH3	Y3	3CH output
	COM3	3CH common terminal of output
CH4	Y4	4CH output
	COM4	4CH common terminal of output
CH5	Y5	5CH output
	COM5	5CH common terminal of output
-	24V+	+24V power supply
	24V-	Common terminal of power supply

Note: XD-E2TC-P only has two channels CH0 and CH1.

16-3. I/O address assignment

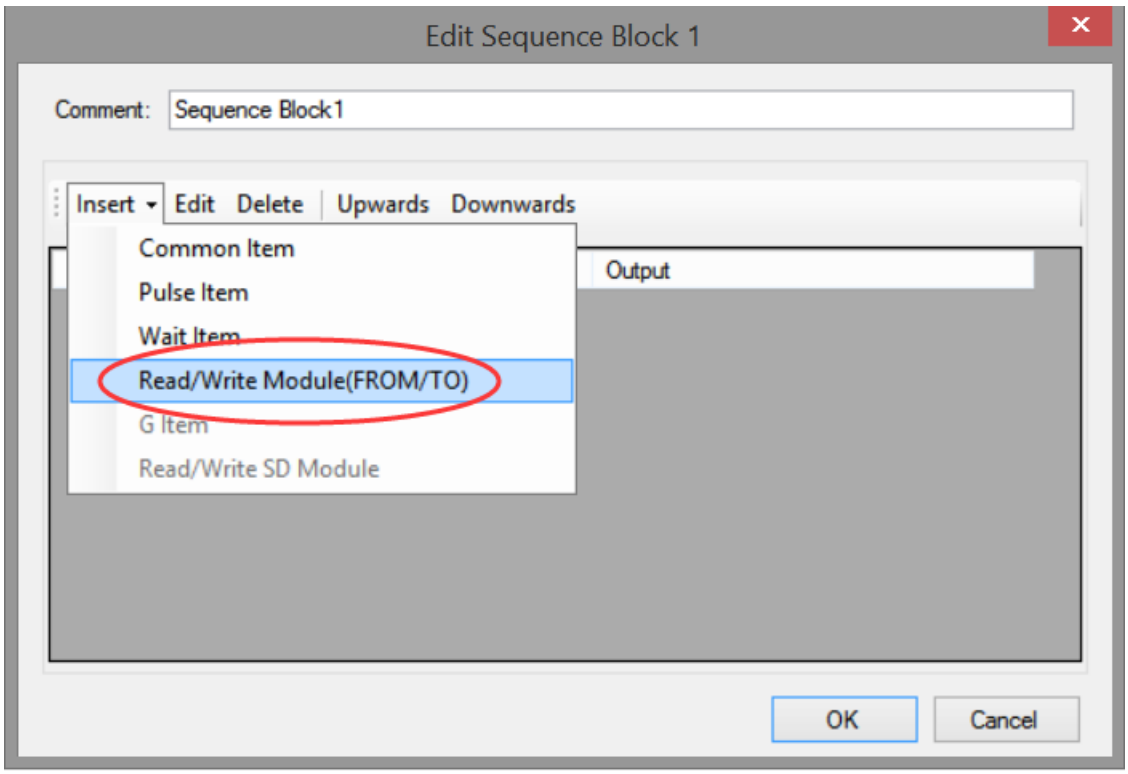
XD series analog module will not occupy I/O unit; the conversion value will be sent to PLC register. Each channel related PLC register address are shown as below:

Parameters	**Explanation**				
	Channel	Ch0	Ch1	……	Ch5
Display temperature Unit: 0.1 ℃	Module 1	ID10000	ID10001	ID1000×	ID10005
	Module 2	ID10100	ID10101	ID10X0×	ID10105
	……	ID10X00	ID10X01	ID10X0×	ID10X05
	Module 16	ID11500	ID11501	ID1150×	ID11505
PID output (return to the X input of PLC)	Module 1	X10000	X10001	X1000×	X10005
	Module 2	X10100	X10101	X1010×	X10105
	……	X10×00	X10×01	X10×0×	X10×05
	Module 16	X11700	X11701	X1170×	X11705
	When the duty cycle of the module is output, the X point should be monitored, not the Y point, because the Y point is the PID enable bit.				
Connection state of thermocouple (0 is connection, 1 is disconnection)	Module 1	X10010	X10011	X1001×	X10015
	Module 2	X10110	X10111	X1011×	X10115
	……	X10××0	X10××1	X10×××	X10××5
	Module 16	X11710	X11711	X1171×	X11715
Enable signal	Module 1	Y10000	Y10001	Y1000×	Y10005
	Module 2	Y10100	Y10101	Y1010×	Y10105
	……	Y1××00	Y1××01	Y1××0×	Y1××05
	Module 16	Y11700	Y11701	Y1170×	Y11705
PID auto-tune error signal bit(0 is normal, 1 is error)	Module 1	X10020	X10021	X1002X	X10025
	Module 2	X10120	X10121	X1012×	X10125
	…..	X1××20	X1××21	X1××2×	X1××25
	Module 16	X11720	X11721	X1172×	X11725
PID control bit	Auto-tune triggered signal, start to auto-tune mode when set to 1				

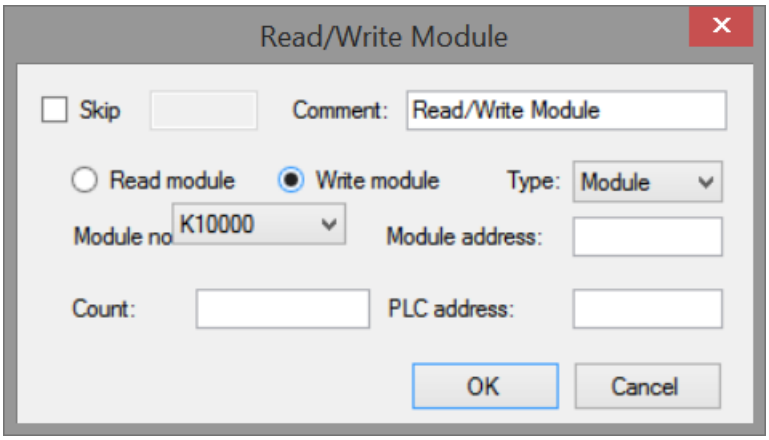
	After auto-tune, PID parameters and temperature control period value are refreshed, the bit value is cleared to be 0. The user can read the bit to know the state. 1 means auto-tune is ongoing. 0 means auto-tune has finished.
PID output (The result)	Digital quantity output range is 0~4095. When the PID output is analog quantity (such as steam valve open degree or silicon-controlled conduction angle), the value can be transmitted to the analog quantity output module in order to realize the control demand.
PID parameters (P, I, D)	The best PID parameters got from the PID auto-tune. If the current PID parameters cannot meet the control requirements, users can set the experience PID parameters to make the module work according to the user setting value.
PID calculation range (Diff) Unit: 0.1℃	PID arithmetic is effective in the range of T (setting temperature) ±Diff. In real temperature control environment, when the temperature is lower than T- Diff, the PID output is the maximum value; when the temperature is higher than T+Diff, the PID output is the minimum value.
Temperature difference value δ Unit: 0.1℃	(sampling temperature value + temperature difference value δ) / 10 = display temperature. At the time the display temperature is the most close to the real temperature. This parameter is a sign value with the unit of 0.1℃, the value is retained when th power is cut off, the defaulted value is 0.
Set temperature Unit: 0.1℃	The target temperature of the control system. Range from 0~1000℃, precision degree is 0.1℃.
Temperature control period Unit: 0.1s	The temperature control period range from 0.5 to 200 seconds, the minimum precision is 0.1 second. The set value = real value × 10. For example: if the real temperature control period is 0.5 seconds, user should set 5 seconds in the module.
Adjusting environment temperature Unit: 0.1℃	If user realizes that the environment temperature is different from display temperature, they can write the correct environment temperature into the module. Then the module will calculate the temperature difference δ and save it. Temperature difference δ = adjusting environment temperature－sampling temperature. Unit: 0.1℃. For example, under the caloric balance condition, users measured the environment temperature is 60℃ with mercury thermometer, but the display temperature is 55℃ (sampling temperature is 550), temperature difference δ is 0. At this time, users can set the parameter to be 600, then the temperature difference δ is 50 (5 ℃). Display temperature = (550 + 50) / 10 = 60 ℃. **Attention: when setting the adjusting environment temperature, make sure it is the same as environment temperature. It is very important because the incorrect parameter will result in mistake of calculating temperature difference δ and affect the display temperature.
auto-tune output range	The auto-tune output unit is percent. 100 means the duty ratio is 100% of the full-scale output, 80 means the duty ratio is 80% of the full-scale output.

Note: when "Y function selection" is set to "immediate output", only channel display temperature value, temperature deviation value δ and calibration environment temperature value are valid in the above parameters, and other parameters do not work.

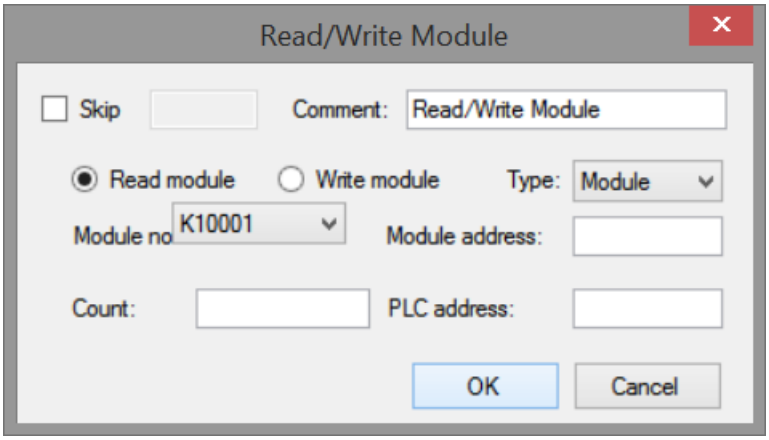
The reading and writing of thermocouple module needs to be completed through the FROM/TO instruction in the sequential function block, as shown in the figure below:



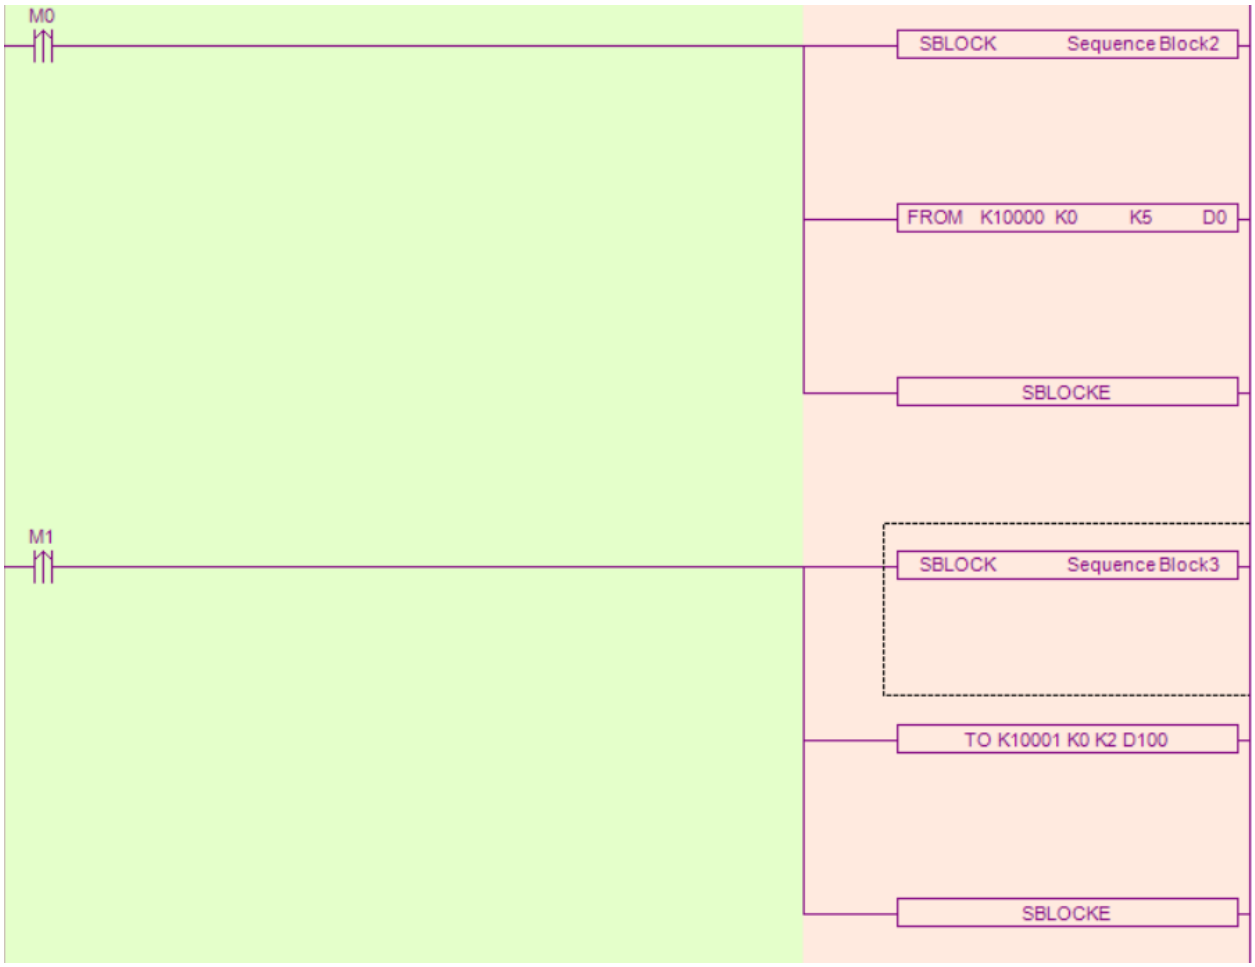
(a) Insert FROM/TO module



(b) Write instruction



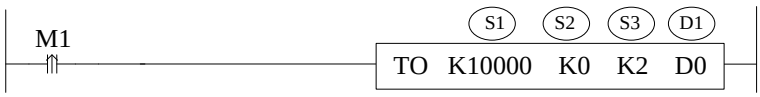
(c) Read instruction



(d) Ladder chart

FROM and TO instructions

Parameter write insruction TO



Function: write the PLC register data to module address, the operate unit is word.

Operand:

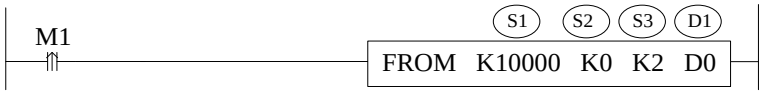
S1: target module number, range: 10000~10015. Operand: K, TD, CD, D, HD, FD

S2: first address of module. Operand: K, TD, CD, D, HD, FD

S3: write in register numbers. Operand: K, TD, CD, D, HD, FD

D1: first address of PLC. Operand: TD, CD, D, HD, FD

Parameter read instruction FROM



Function: read the module data to the PLC regsiter, the operate unit is word.

S1: target module number, range: 10000~10015. Operand: K, TD, CD, D, HD, FD
S2: first address of module. Operand: K, TD, CD, D, HD, FD
S3: read register numbers. Operand: K, TD, CD, D, HD, FD
D1: first address of PLC. Operand: TD, CD, D, HD, FD

Note:
1: FROM/TO instruction can only be written in sequence function block, XD series PLC with firmware version less than v3.4.5 only allows up to 8 block function blocks; XD / XL series PLC with firmware version v3.4.5 and above can write up to 100 blocks in the program, but can only run up to 8 blocks at the same time.
2: The starting number of module starts from K10000, K10000 for # 1 module and k10001 for # 2 module. By analogy, # 16 module is K10015.
3: In v3.3 and below version software, the module number range is K0~K15. Please pay attention to the modification when transferring projects in different versions of software.

PID	Kp	40	K13	K17	K21	K25	K29	K33	RW
	Ki	240	K14	K18	K22	K26	K30	K34	RW
	Kd	60	K15	K19	K23	K27	K31	K35	RW
	Diff	1000	K16	K20	K24	K28	K32	K36	RW
Temperature control period (unit: 0.1s)		20	K37	K38	K39	K40	K41	K42	RW
Output range (0~100)		100	K43	K44	K45	K46	K47	K48	RW
Temperature deviation calibration		0	K49	K50	K51	K52	K53	K54	RW
Present actual temperature, can be used to calibrate		-	K55	K56	K57	K58	K59	K60	W
From/To data initialization		-	K61	K61	K61	K61	K61	K61	W

XD-E2TC-P:

From/To data		Default value	CH1	CH2	R/W
Auto-tune enable		0	K0	K0	RW
PID output		-	K1	K2	R
Setting value		0	K3	K4	RW
PID	Kp	40	K5	K9	RW

	Ki	240	K6	K10	RW
	Kd	60	K7	K11	RW
	Diff	1000	K8	K12	RW
Temperature control period (unit: 0.1s)		20	K13	K14	RW
Output range (0~100)		100	K15	K16	RW
Temperature deviation calibration		0	K17	K18	RW
Present actual temperature, can be used to calibrate		-	K19	K20	W
From/To data initialization		-	K21	K21	W

Note: the "from / to data initialization" function requires the firmware version of the module to be V10 or V104 and higher. This function can restore the parameters in the above table to the factory settings. When using it, you need to set K61 or K21 to 1, and set to other values are invalid.

The module can automatically save the set temperature value, PID parameters, temperature control cycle, output range, temperature deviation and temperature calibration parameters. When writing the above parameters, the rising edge should be used to trigger the writing. It is recommended to write only the parameters used. It is not recommended to write the whole piece of data for the convenience of programming, because writing 0 to some addresses will cause the system to fail to work.

16-4. Working mode

There are two ways to set the working mode:

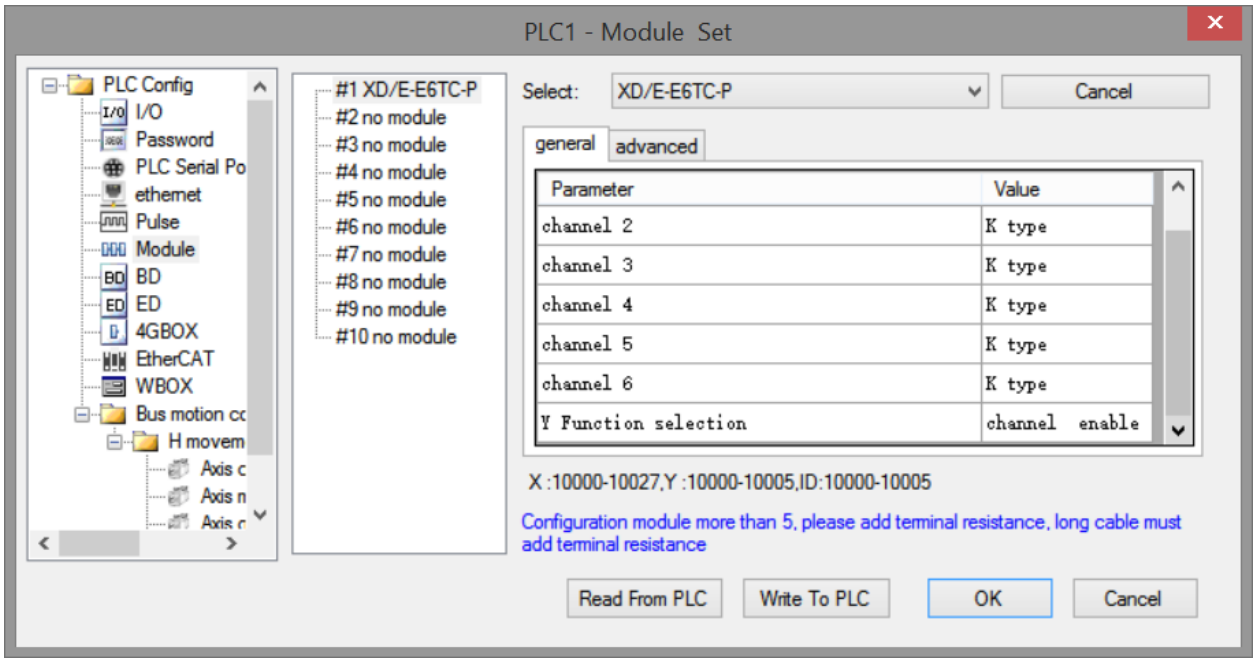
1. XDPpro software
2. Flash registers of PLC

XDPpro software:

Open the XDPpro software, click configure/expansion module settings:

Set the model and channel parameters in the following window. Then click write to PLC.

Please restart the PLC after setting.



Flash registers:

Set the thermocouple type through SFD registers of PLC:

Module no.	SFD address	Module no.	SFD address
#1	SFD350~SFD359	#9	SFD430~SFD439
#2	SFD360~SFD369	#10	SFD440~SFD449
#3	SFD370~SFD379	#11	SFD450~SFD459
#4	SFD380~SFD389	#12	SFD460~SFD469
#5	SFD390~SFD399	#13	SFD470~SFD479
#6	SFD400~SFD409	#14	SFD480~SFD489
#7	SFD410~SFD419	#15	SFD490~SFD499
#8	SFD420~SFD429	#16	SFD500~SFD509

SFD bit definition:

Expansion module no.1 setting:

</table>

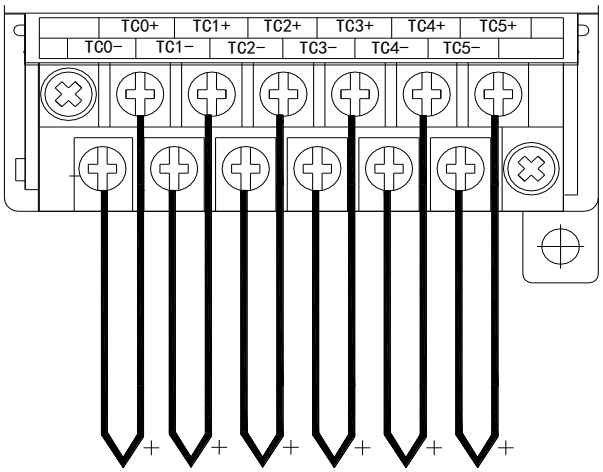
Note: XD-E2TC-P only has two channels TC0 and TC1.

16-5. Exterior connection

About the exterior connection, please pay attention to the following items:

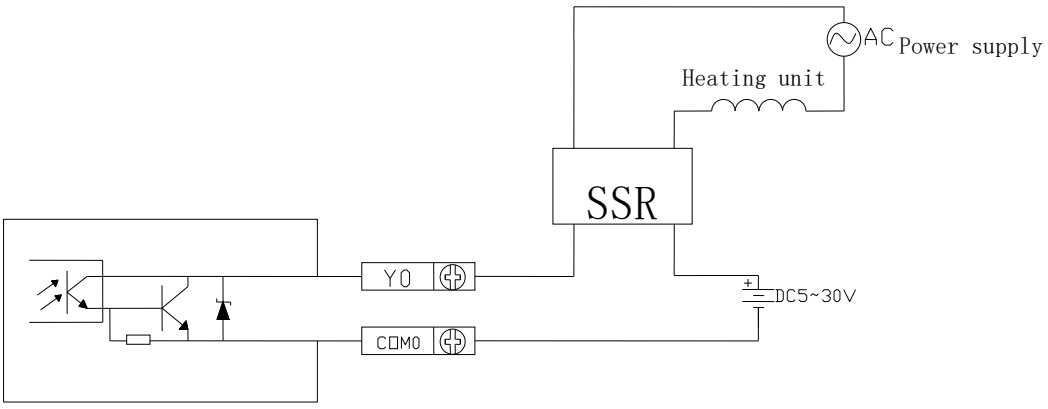
- When connect to＋24V power, please use the 24V power supply of PLC to avoid interference.
- To avoid interference, shielding measure is necessary for signal cables.

Input connection:



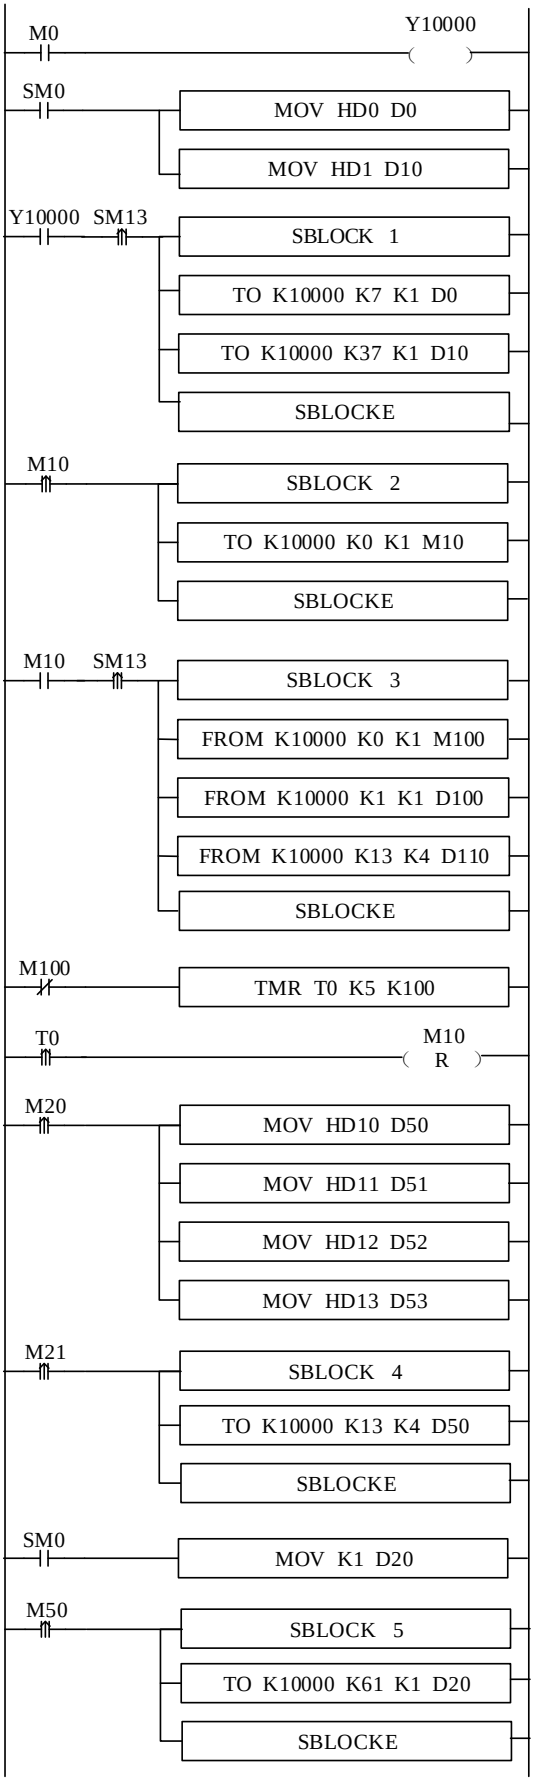
Output circuit:

- Output terminal
  For transistor output terminals, please use DC5V~30V power supply.
- Circuit insulation
  PLC internal circuit and output transistor is optical insulation with optical coupling device. Each public module is separate.
- Response time
  The time is less than 0.2ms from PLC driving (or cut) optical coupling circuit to transistor ON/OFF.
- Output circuit
  Each point current is 50mA to avoid over-heating.
- Open circuit leak current
  Below 0.1mA.



16-6. Programming

Example: programming for the first channel.



// set ON the PID enable bit

// set the target value (unit: 0.1℃)

// set temperature control cycle (unit: 0.1s)

//write in the target value, temperature control period

// write in auto-tune bit

// read auto-tune bit and PID parameters

// read auto-tune bit

// read PID output value

// read P, I, D, DIFF parameters

//after auto-tune bit reset for 0.5s, reset auto-tune flag bit

//set P value

//set I value

//set D value

//set Diff value

//manually PID control, write in PID parameters

//initialize the module parameters

Explanation:

(1) When the auto-tuning enable is turned on, the command will immediately occupy 8 bits of M10-M17 in total. M10-M15 corresponds to the auto-tuning enable of each channel. M16 and M17 have no meaning and need to be left blank.

(2) If the output is a solid state relay, the temperature control cycle is recommended to be 1 ~ 3s; if the output is a relay, the temperature control cycle is recommended to be 3 ~ 15s.

(3) Due to the inconsistency of units, the parameters of PLC main body PID and module PID cannot be used in common. The PID parameters of the PLC are in upper case and the PID parameters of the module are in lower case. The specific conversion relations are as follows: p= P/100; i=I/10; d=D/100.

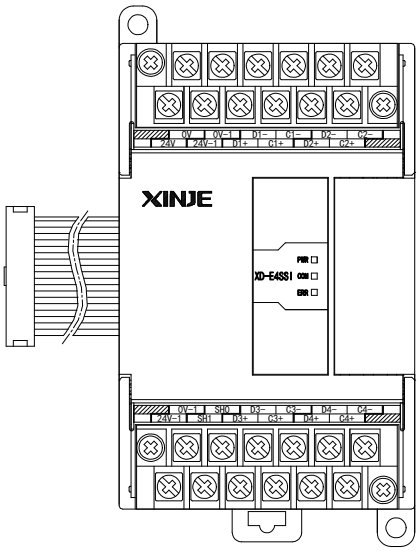
Soft component functions:

M0	Set ON the PID enable
SM0	Set the target value, temperature control bit
M10	Write in auto-tune bit
M20	Set manually PID parameters
M21	Write-in manually PID parameters
M10	Read auto-tune bit, PID parameters, PID output
M50	Initialize the module
Y10000	PID enable bit of channel 0
D0	Set the target value
D10	Temperature control period
D50	P
D51	I
D52	D
D53	DIFF

17. SSI encoder detection module XD-E4SSI

17-1. Specification

This chapter mainly introduces XD-E4SSI module specifications, terminal arrangement, data address description, module configuration, external wiring and related programming examples.



Features:

XD-E4SSI encoder detection module detects the position of absolute value encoder or position sensor, and transmits them to PLC main unit.

- Support 4-channel SSI absolute encoder position detection or 4-channel position sensor detection.
- Suitable for 10 ~ 31bits SSI encoder.
- The communication frequency of 125kHz ~ 1MHz is supported.
- Support gray code or binary format coding.
- It has the function of disconnection detection and alarm.
- As a special function module of XD series, XD3 can connect up to 10 modules on the right side of PLC main unit, XD5/XDM/XDC/XD5E/XDME can expand 16 modules, XD1/XD2 does not support expansion modules.

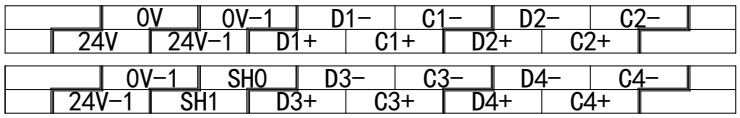
Specifications:

Item	Contents
Input signal	SSI absolute value encoder or position sensor signal
Power supply	DC24V (input range 20.4~28.8V)
Module consumption	1W (without load)
Position detection mode	Absolution mode
Difference between SSI data and clock signal	Accords to RS422 standards
Encoder bits	10-bit~31-bit
Digital output range	0~encoder max feedback value

Item	Contents
Resolution	1/ encoder max feedback value
Communication frequency	125KHz~1MHz
Coding type	Gray or binary coding
Integrated precision	1% (relative max value)
Conversion speed	400us per channel
Power supply for encoder	DC24V ±10%, 100mA or 300mA
Length of shielded twisted pair	Communication frequency 125KHz: max 320m Communication frequency 250KHz: max 160m Communication frequency 500KHz: max 60m Communication frequency 1MHz: max 20m

17-2 Terminal explanation

Terminal arrangement:



Terminal signals:

Channel	Terminal	Name
CH0	D1+	Data receive +
	D1-	Data receive -
	C1+	Clock send +
	C1-	Clock send -
CH1	D2+	Data receive +
	D2-	Data receive -
	C2+	Clock send +
	C2-	Clock send -
CH2	D3+	Data receive +
	D3-	Data receive -
	C3+	Clock send +
	C3-	Clock send -
CH3	D4+	Data receive +
	D4-	Data receive -
	C4+	Clock send +
	C4-	Clock send -
Module power supply	24V	+24V power supply
	0V	Common terminal of power supply
Encoder power supply	24V-1	Supply +24V power supply to the encoder
	0V-1	Common terminal of power supply for encoder

Shielded terminal	SH0	Connect encoder shielded ground
	SH1	Connect encoder shielded ground

17-3. The assignment of I/O address

XD series analog module does not occupy the I / O unit, and the converted value is directly sent to the PLC register. The definition number of PLC register corresponding to the channel is as follows:
Note: each channel can only be used when it is enabled.

Register definition number of the first expansion module

Channel	Encoder signal (dword)	Channel enable bit	Disconnection alarm
0CH	ID10000	Y10000	X10000
1CH	ID10002	Y10001	X10001
2CH	ID10004	Y10002	X10002
3CH	ID10006	Y10003	X10003

Register definition number of the second expansion module

Channel	Encoder signal (dword)	Channel enable bit	Disconnection alarm
0CH	ID10100	Y10100	X10100
1CH	ID10102	Y10101	X10101
2CH	ID10104	Y10102	X10102
3CH	ID10106	Y10103	X10103

Register definition number of the third expansion module

Channel	Encoder signal (dword)	Channel enable bit	Disconnection alarm
0CH	ID10200	Y10200	X10200
1CH	ID10202	Y10201	X10201
2CH	ID10204	Y10202	X10202
3CH	ID10206	Y10203	X10203

Register definition number of the fourth expansion module

Channel	Encoder signal (dword)	Channel enable bit	Disconnection alarm
0CH	ID10300	Y10300	X10300
1CH	ID10302	Y10301	X10301
2CH	ID10304	Y10302	X10302
3CH	ID10306	Y10303	X10303

Register definition number of the fifth expansion module

Channel	Encoder signal (dword)	Channel enable bit	Disconnection alarm
0CH	ID10400	Y10400	X10400
1CH	ID10402	Y10401	X10401
2CH	ID10404	Y10402	X10402
3CH	ID10406	Y10403	X10403

Register definition number of the sixth expansion module

Channel	Encoder signal (dword)	Channel enable bit	Disconnection alarm
0CH	ID10500	Y10500	X10500
1CH	ID10502	Y10501	X10501
2CH	ID10504	Y10502	X10502
3CH	ID10506	Y10503	X10503

Register definition number of the seventh expansion module

Channel	Encoder signal (dword)	Channel enable bit	Disconnection alarm
0CH	ID10600	Y10600	X10600
1CH	ID10602	Y10601	X10601
2CH	ID10604	Y10602	X10602
3CH	ID10606	Y10603	X10603

Register definition number of the eighth expansion module

Channel	Encoder signal (dword)	Channel enable bit	Disconnection alarm
0CH	ID10700	Y10700	X10700
1CH	ID10702	Y10701	X10701
2CH	ID10704	Y10702	X10702
3CH	ID10706	Y10703	X10703

Register definition number of the ninth expansion module

Channel	Encoder signal (dword)	Channel enable bit	Disconnection alarm
0CH	ID10800	Y11000	X11000
1CH	ID10802	Y11001	X11001
2CH	ID10804	Y11002	X11002
3CH	ID10806	Y11003	X11003

Register definition number of the tenth expansion module

Channel	Encoder signal (dword)	Channel enable bit	Disconnection alarm
0CH	ID10900	Y11100	X11100
1CH	ID10902	Y11101	X11101
2CH	ID10904	Y11102	X11102
3CH	ID10906	Y11103	X11103

Register definition number of the eleventh expansion module

Channel	Encoder signal (dword)	Channel enable bit	Disconnection alarm
0CH	ID11000	Y11200	X11200
1CH	ID11002	Y11201	X11201
2CH	ID11004	Y11202	X11202
3CH	ID11006	Y11203	X11203

Register definition number of the twelfth expansion module

Channel	Encoder signal (dword)	Channel enable bit	Disconnection alarm
0CH	ID11100	Y11300	X11300
1CH	ID11102	Y11301	X11301
2CH	ID11104	Y11302	X11302
3CH	ID11106	Y11303	X11303

Register definition number of the thirteenth expansion module

Channel	Encoder signal (dword)	Channel enable bit	Disconnection alarm
0CH	ID11200	Y11400	X11400
1CH	ID11202	Y11401	X11401
2CH	ID11204	Y11402	X11402
3CH	ID11206	Y11403	X11403

Register definition number of the fourteenth expansion module

Channel	Encoder signal (dword)	Channel enable bit	Disconnection alarm
0CH	ID11300	Y11500	X11500
1CH	ID11302	Y11501	X11501
2CH	ID11304	Y11502	X11502
3CH	ID11306	Y11503	X11503

Register definition number of the fifteenth expansion module

Channel	Encoder signal (dword)	Channel enable bit	Disconnection alarm
0CH	ID11400	Y11500	X11500
1CH	ID11402	Y11501	X11501
2CH	ID11404	Y11502	X11502
3CH	ID11406	Y11503	X11503

Register definition number of the sixteenth expansion module

Channel	Encoder signal (dword)	Channel enable bit	Disconnection alarm
0CH	ID11500	Y11600	X11600
1CH	ID11502	Y11601	X11601
2CH	ID11504	Y11602	X11602
3CH	ID11506	Y11603	X11603

Note:

1: The scanning speed of input can be improved by forbidding unused channels.

2: When the input enable switch is turned off during operation, the corresponding input channel data will not be refreshed.

3: Disconnection alarm is used to detect whether the data and clock signal cables of the channel are disconnected or reversed.

4: When each channel is initially powered on, the ID register is 0.

17-4. Working mode

There are two ways to set the working mode:

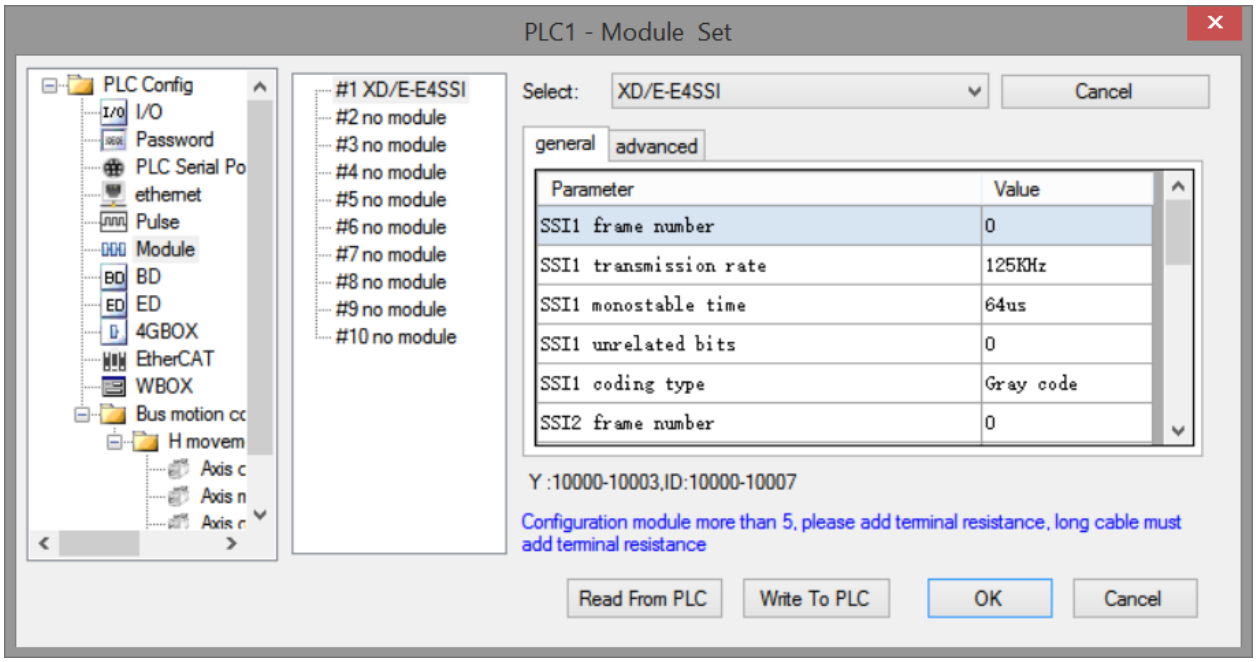
1. XDPpro software
2. Flash registers of PLC

XDPpro software:

Open the XDPpro software, click configure/expansion module settings:

Set the model and channel parameters in the following window. Then click write to PLC.

Please restart the PLC after setting.



Flash registers:

The CH0 ~ CH3 channel parameters of the expansion module can be set through the special flash data register FD in PLC. As follows:

Module no.	SFD address	Module no.	SFD address
#1	SFD350~SFD359	#9	SFD430~SFD439
#2	SFD360~SFD369	#10	SFD440~SFD449
#3	SFD370~SFD379	#11	SFD450~SFD459
#4	SFD380~SFD389	#12	SFD460~SFD469
#5	SFD390~SFD399	#13	SFD470~SFD479

#6	SFD400~SFD409	#14	SFD480~SFD489
#7	SFD410~SFD419	#15	SFD490~SFD499
#8	SFD420~SFD429	#16	SFD500~SFD509

SFD definitions:

Take module 1 as an example:

Register		Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	Note
SFD350	Byte0	SSI1 frame number (0, 10-31BIT)								
	Byte1	SSI2 frame number (0, 10-31BIT)								
SFD351	Byte2	SSI3 frame number (0, 10-31BIT)								
	Byte3	SSI4 frame number (0, 10-31BIT)								
SFD352	Byte4	-	SSI2 transmission rate			-	SSI1 transmission rate			
		X	0：125KHz 1：250KHz 2：500KHz 3：1MHz			X	0：125KHz 1：250KHz 2：500KHz 3：1MHz			
	Byte5	-	SSI4 transmission rate			-	SSI3 transmission rate			
		X	0：125KHz 1：250KHz 2：500KHz 3：1MHz			X	0：125KHz 1：250KHz 2：500KHz 3：1MHz

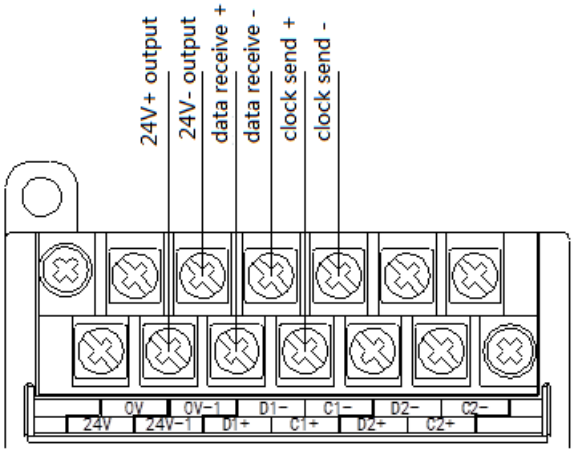
	Byte11	-								
SFD356~SFD359		-								

17-5 External connection

When external connection, pay attention to the following aspects:

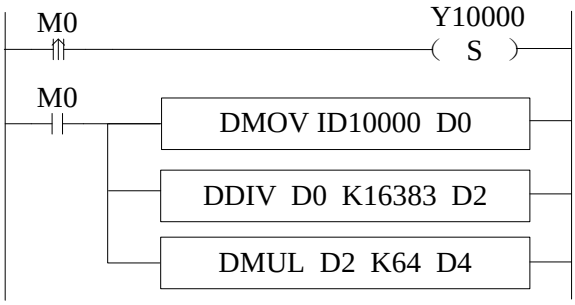
- In order to avoid interference, please use shielded wire and ground the shielding layer at a single point.
- The XD-E4SSI power supply should be connected to the 24V output terminal on the PLC body as far as possible to avoid interference.
- When the module power supply is supplied by the PLC, it can output 100mA (16-point PLC) or 300 mA (24-point PLC and above) current through the 24V-1 and 0V-1 terminals. When the current exceeds this value, the encoder needs to be connected with external 24 V power supply.

Input wiring:



17-6 Program example

Example 1: there is one channel of position sensor needs to measure the distance (measuring range: 0-64mm; encoder number: 16 bits). Here we use the first channel of the # 1 module to measure.
The procedure is as follows:



// Turn on channel 1 enable bit

// Send the detection value to D0

// Calculate the proportion relationship

// Get the current displacement

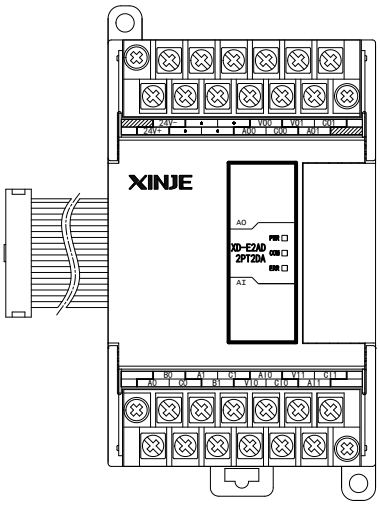
Note:
First of all, when configuring the module, please set the frame number of SSI1 to 16, and other parameters can be set by default.
The program is as shown in the figure above. Take M0 as the ranging function switch. When the rising edge of

M0 comes, turn on the first channel enable bit.
Because the frame number of SSI1 is 16, the range of ID10000 is 0 ~ 65535, and the range of corresponding displacement sensor is 0 ~ 64mm. Therefore, the digital quantity can be converted into displacement through simple operation of the module.
Assuming that the number in ID10000 is 4095, the corresponding displacement is 64 ×(4095 / 65535) = 4mm.

18. Analog extension module XD-E2AD2PT2DA

18-1. Specification

This chapter will introduce the XD-E2AD2PT2DA module specification, terminal and I/O assignment, working mode, external wiring, AD diagram and programming example.



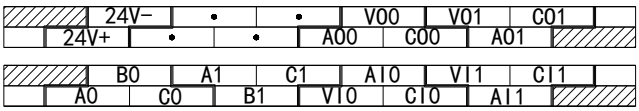
Features:
XD-E2AD2PT2DA analog expansion module converts two channels of analog input values into digital values, processes two PT100 temperature signals, converts two channels of digital values into analog values, and transmits them to PLC main unit for real-time data interaction with PLC main unit.

- It has 2 channels of 16-bit precision analog input, 2-channel PT100 temperature input and 2-channel 10-bit precision analog output.
- Current and voltage are optional, and current is 0-20mA and 4-20mA; voltage is 0-5V and 0-10V, which is set by upper computer.
- As an extension module of XD series, XD3 series can connect up to 10 modules; XD5/XDM/XDC/XD5E/XDME series can connect up to 16 modules (not supported by XD1/XD2 series)

Specifications:

Item	Analog input (AD)		Temperature input (PT)	Analog output (DA)	
	Voltage input (V)	Current input (mA)		Voltage output (V)	Current output (mA)
Analog input range	0~5,0~10V (impedance > 1M)	0~20,4~20mA (impedance is about 120Ω)	-100~500℃	—	
Max input range	DC 0~15V	20~40mA	—		
Analog output range	—		—	0~5, 0~10V External load resistor 2KΩ~1MΩ	0~20, 4~20mA External load resistor < 500Ω
Digital input range	—		—	10-bit binary (0~1023)	
Digital output range	16-bit binary (0~65535)		-1000~5000	—	
Resolution	1/65535(16Bit)		0.1℃	1/1023(10Bit)	
Integrated precision	±0.8%		±1% (relative max value)	±1%	
Conversion speed	2ms per channel			2ms per channel	
Module power supply	DC24V ±10%, 150mA				

18-2. Terminals



Channel	Terminal	Signal name
CH0	AI0	Current input
	VI0	Voltage input
	C0	CH0 common terminal of analog input
CH1	AI1	Current input
	VI1	Voltage input
	C1	CH1 common terminal of analog input
CH0	A0	CH0 temperature input
	B0	CH0 input common terminal
	C0	CH0 input common terminal

CH1	A1	CH1 temperature input
	B1	CH1 input common terminal
	C1	CH1 input common terminal
CH0	AO0	Current output
	VO0	Voltage output
	C0	CH0 common terminal of analog output
CH1	AO1	Current output
	VO1	Voltage output
	C1	CH1 common terminal of analog output
-	24V+	+24V power supply
	24V-	Power supply common terminal

18-3. The assignment of I/O address

XD series analog modules do not occupy I/O units; the converted data is directly transferred into PLC register.
Note: each channel can work after turning on the enable bit.

Register address of module 1:

AD Channel	AD signal	Channel enable bit
0CH	ID10000 (dword)	Y10000
1CH	ID10002 (dword)	Y10001
PT channel	PT signal	Channel enable bit
0CH	ID10004	Y10002
1CH	ID10005	Y10003
DA channel	DA signal	Channel enable bit
0CH	QD10000	Y10004
1CH	QD10001	Y10005

Register address of module 2:

AD Channel	AD signal	Channel enable bit

0CH	ID11404	Y11402
1CH	ID11405	Y11403
DA channel	DA signal	Channel enable bit
0CH	QD11400	Y11404
1CH	QD11401	Y11405

Register address of module 14:

AD channel	AD signal	Channel enable bit
0CH	ID11500 (dword)	Y11500
1CH	ID11502 (dword)	Y11501
PT channel	PT signal	Channel enable bit
0CH	ID11504	Y11502
1CH	ID11505	Y11503
DA channel	DA signal	Channel enable bit
0CH	QD11500	Y11504

1CH	QD11501	Y11505

Register address of module 15:

AD channel	AD signal	Channel enable bit
0CH	ID11600 (dword)	Y11600
1CH	ID11602 (dword)	Y11601
PT channel	PT signal	Channel enable bit
0CH	ID11604	Y11602
1CH	ID11605	Y11603
DA channel	DA signal	Channel enable bit
0CH	QD11600	Y11604
1CH	QD11601	Y11605

Register address of module 16:

AD channel	AD signal	Channel enable bit
0CH	ID11700 (dword)	Y11700
1CH	ID11702 (dword)	Y11701
PT channel	PT signal	Channel enable bit
0CH	ID11704	Y11702
1CH	ID11705	Y11703
DA channel	DA signal	Channel enable bit
0CH	QD11700	Y11704
1CH	QD11701	Y11705

Note:

1. Forbid the unused channel to improve the I/O scanning speed.
2. If turn off the enable bit of the input channel, this channel will not accept the data. (the data display is 0).
3. If turn off the enable bit of the output channel, this channel will keep the former data.

18-4. Working mode

There are two ways to set the working mode:

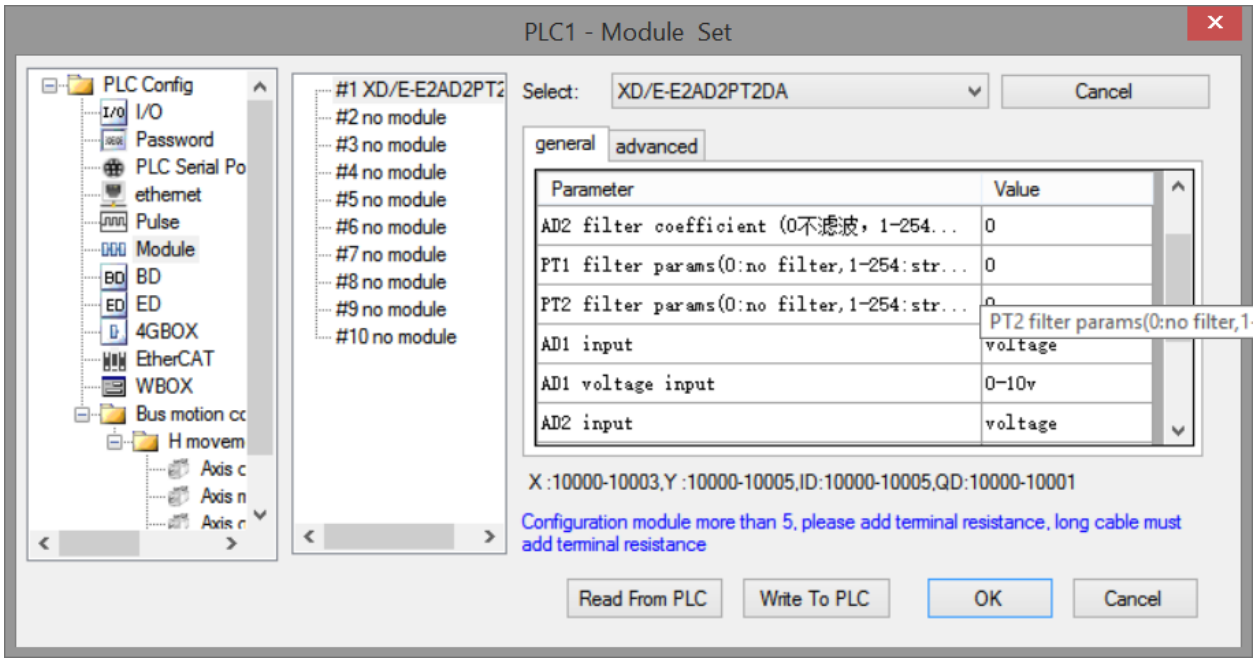
1. XDPpro software
2. Flash registers of PLC

XDPpro software:

Open the XDPpro software, click configure/expansion module settings.

Set the model and channel parameters in the following window. Then click write to PLC.

Please restart the PLC after setting.



Note:

1. first-order low-pass filter will weight present sampling value with last time filter output to get the final filter value.
2. The filter parameter range is 0 to 254, the smaller the value is, the more stable the data is, but it may cause data lag; therefore, when it is set to 1, the filtering effect is the strongest and the data is the most stable; when it is set to 254, the filtering effect is the weakest and the default is 0 (no filtering).

Flash registers:

The module has current and voltage mode. Current has choices of 0~20mA, 4~20mA; voltage has choices of 0~5V, 0~10V. These parameters can be set through SFD registers.

Module no.	SFD address	Module no.	SFD address
#1	SFD350~SFD359	#9	SFD430~SFD439
#2	SFD360~SFD369	#10	SFD440~SFD449
#3	SFD370~SFD379	#11	SFD450~SFD459
#4	SFD380~SFD389	#12	SFD460~SFD469
#5	SFD390~SFD399	#13	SFD470~SFD479
#6	SFD400~SFD409	#14	SFD480~SFD489

#7	SFD410~SFD419	#15	SFD490~SFD499
#8	SFD420~SFD429	#16	SFD500~SFD509

Note: As shown in the preceding table, every register set 4 channels mode, each register has 16 bits, from low to high, every 4 bits set 1 channel mode.

SFD register bit definition:

Module no.1:

<table>
<tr><th colspan="2">Register</th><th>Bit7</th><th>Bit6</th><th>Bit5</th><th>Bit4</th><th>Bit3</th><th>Bit2</th><th>Bit1</th><th>Bit0</th><th>Note</th></tr>
<tr><td rowspan="2">SFD350</td><td>Byte0</td><td colspan="8">AD channel 0 filter parameter</td><td rowspan="2">AD filter parameter</td></tr>
<tr><td>Byte1</td><td colspan="8">AD channel 1 filter parameter</td></tr>
<tr><td rowspan="2">SFD351</td><td>Byte2</td><td colspan="8">PT channel 0 filter parameter</td><td rowspan="2">PT filter parameter</td></tr>
<tr><td>Byte3</td><td colspan="8">PT channel 1 filter parameter</td></tr>
<tr><td rowspan="4">SFD352</td><td rowspan="2">Byte4</td><td>Bit7</td><td>Bit6</td><td>Bit5</td><td>Bit4</td><td>Bit3</td><td>Bit2</td><td>Bit1</td><td>Bit0</td><td rowspan="6">It is used to specify the input range of AD and DA modules. The lower 4 bits of byte4 are the set bits of AD channel 1, and the higher 4 bits are the set bits of AD channel 2. The low 4 bits of byt5 are the setting bits of DA channel 1, and the high 4 bits are the setting bits of DA channel 2.</td></tr>
<tr><td colspan="4">AD2</td><td colspan="4">AD1</td></tr>
<tr><td>-</td><td colspan="3">000：0~10V
001：0~5V
010：0~20mA
011：4~20mA</td><td>-</td><td colspan="3">000：0~10V
001：0~5V
010：0~20mA
011：4~20mA</td></tr>
<tr><td rowspan="3">Byte5</td><td>Bit7</td><td>Bit6</td><td>Bit5</td><td>Bit4</td><td>Bit3</td><td>Bit2</td><td>Bit1</td><td>Bit0</td></tr>
<tr><td colspan="4">DA2</td><td colspan="4">DA1</td></tr>
<tr><td>-</td><td colspan="3">000：0~10V
001：0~5V
010：0~20mA
011：4~20mA</td><td>-</td><td colspan="3">000：0~10V
001：0~5V
010：0~20mA
011：4~20mA</td></tr>
<tr><td colspan="2">SFD353~SFD359</td><td colspan="8">-</td></tr>
</table>

For example:

Set the module no.1 AD channel 3, 2, 1, 0 working mode to 0～20mA, 4～20mA, 0～10V, 0～5V. Set the channel 1 and 2 filter factor to 254, set the channel 3 and 4 filter factor to 100. Set DA channel 1 and 0 working mode to 0~10V, 0~20mA.

So the SFD register values are:

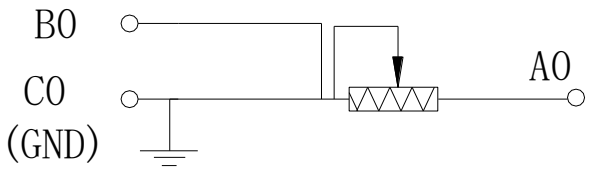
SFD350=64FEH　　SFD351=4C1H　　SFD352=10H

18-5. Exterior connection

When make exterior connection, please read the following items:

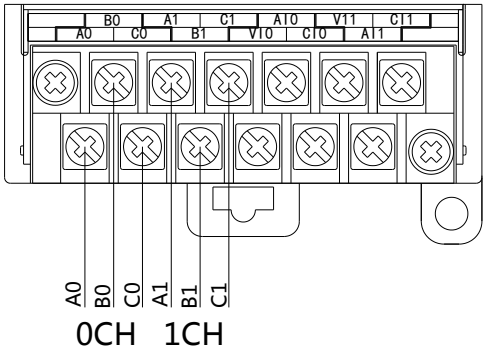
- When connect＋24V power, please choose 24V power of PLC to avoid interference.
- To avoid interference, please use shield cable and single point ground for the shield layer.

3-wire mode PT100 resistor input wiring diagram:

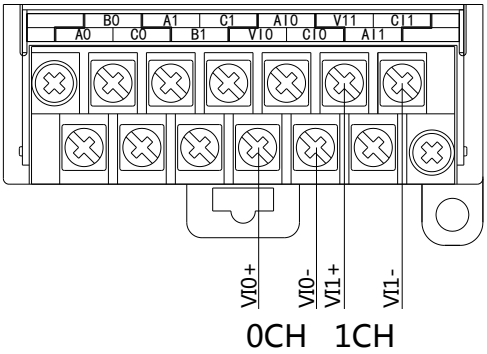


For the general three wire PT100 platinum thermistor, the wiring mode can be distinguished according to the wire color. The two wires of the same color can be randomly connected to terminal B0 and C0, and the other end can be connected to terminal A0.

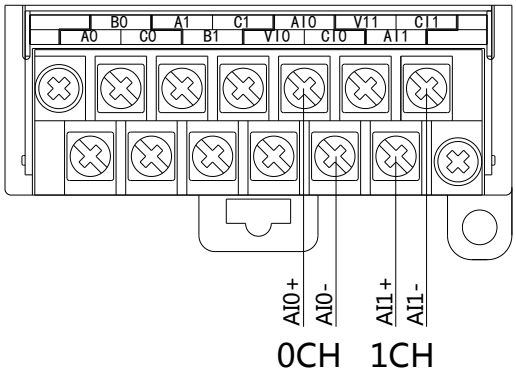
Three wire thermocouple input



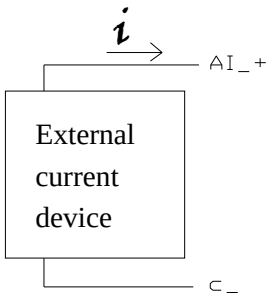
Voltage input



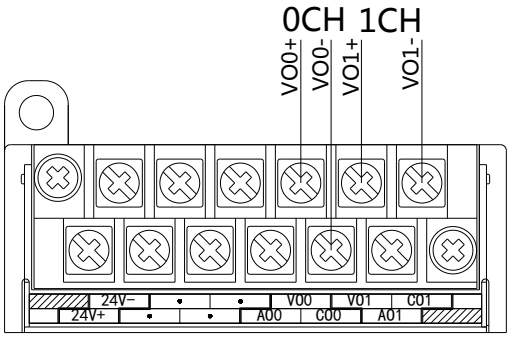
Current input



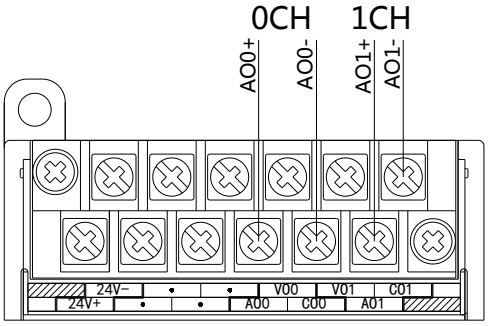
XD-E2AD2PT2DA current input wiring:



Voltage output



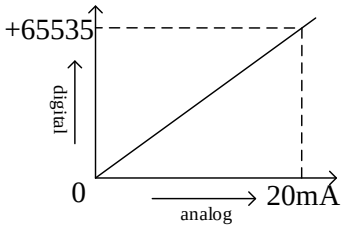
Current output

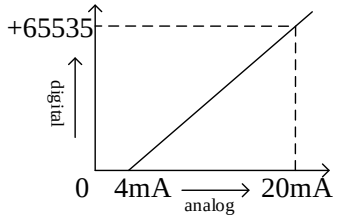


Note: the current output no needs to connect DC24V power supply.

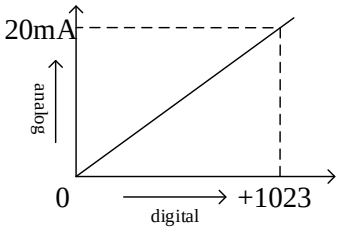
18-6. AD conversion diagram

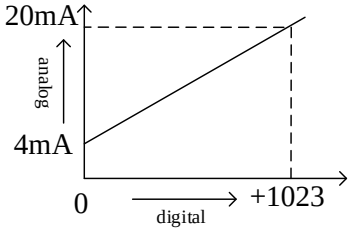
The relationship between analog input and corresponding digital value:

0-5V analog input	0-10V analog input
	0-20mA analog input	4-20mA analog input
	




The relationship between input digital value and corresponding analog value:

0-5V analog output	0-10V analog output
	0-20mA analog output	4-20mA analog output
	




Note: When input data exceeds K1023, analog output will keep the value of 5V, 10V or 20mA.

18-7. Programming

Example:

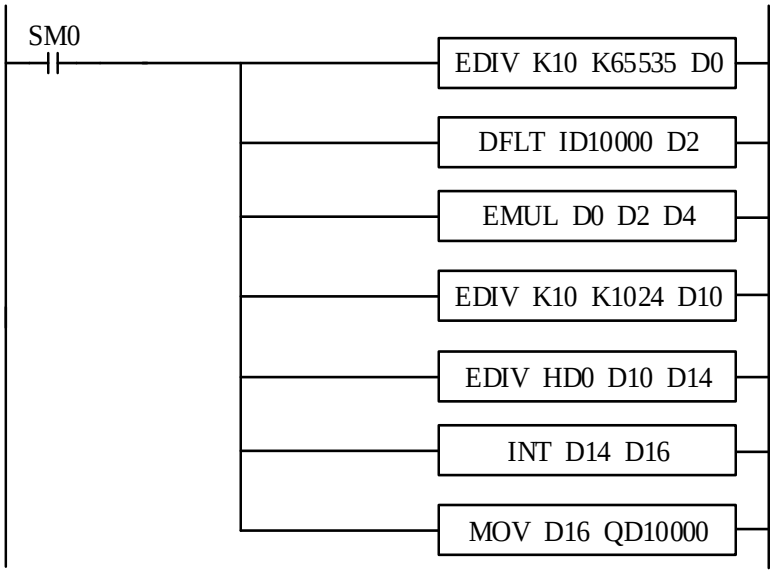
The output signal of the existing pressure sensor needs to be collected (pressure sensor performance parameters: detection pressure range 0Mp ~ 10Mp, output analog signal 4 ~ 20mA), and one channel of 0V ~ 10V voltage signal needs to be output to the inverter.

Analysis: because the pressure detection range of the pressure sensor is 0Mp ~ 10Mp, the corresponding output analog quantity is 4 ~ 20mA, and the digital quantity range of the expansion module through analog-to-digital conversion is 0 ~ 65535; therefore, we can skip the analog quantity 4 ~ 20mA of the intermediate conversion link, which directly means that the pressure detection range is 0Mp ~ 10Mp, and the corresponding digital quantity range is 0 ~ 65535; 10Mp / 65536 = 0.0001525879, the real-time pressure of the current pressure sensor is the real-time value collected in the ID register of the expansion module multiplied by 0.0001525879. For example, if the digital value collected in the ID register is 16384, the corresponding pressure is 2.5Mp.

Similarly, the range of digital value set in the register QD of the expansion module is 0 ~ 1023, which corresponds to the voltage output signal 0V ~ 10V, and 10V / 1024 = 0.0097656, which indicates how much voltage value is output for each digital value set in the register QD of the expansion module. For example, 3V voltage value needs to be output now, 3V / 0.0024414 = 307, and the calculated digital value is sent to the corresponding QD register.

Note: please use floating-point number for calculation, otherwise the calculation accuracy will be affected or even unable to calculate!

Program:



Explanation:

SM0 is normally on coil, which is always on during PLC operation.

When PLC starts to run, analog quantity acquisition first calculates the pressure value corresponding to each digit 1 of the digital quantity collected by the expansion module, and then converts the digital quantity (integer) collected in ID10000 register into floating-point number. So the real-time value collected in ID10000 register

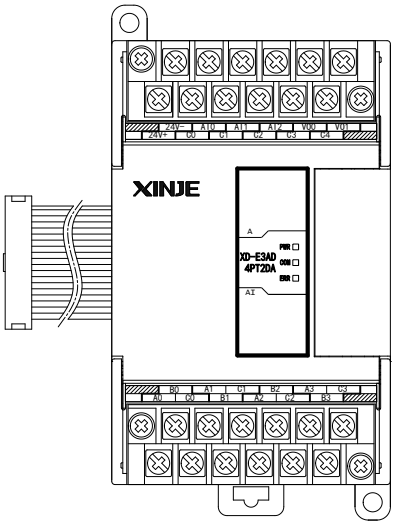
of the expansion module is multiplied by the pressure value corresponding to each digit 1 of the digital quantity collected by the expansion module, it can be calculated the collected real-time pressure value.

Similarly, the analog output first calculates the voltage value corresponding to each digit 1 of the digital quantity collected by the expansion module, then divides the set target voltage value by it to get the set digital value (floating point number). Since QD10000 register can only store integers, it is necessary to convert the floating-point number to integer and send to QD10000.
Note: please turn on the enable bit of the used channel, that is, set Y10000 and Y1004 to on.

19. Analog extension module XD-E3AD4PT2DA

19-1. Specification

This chapter will introduce the XD-E3AD4PT2DA module specification, terminal and I/O assignment, working mode, external wiring, AD diagram and programming example.



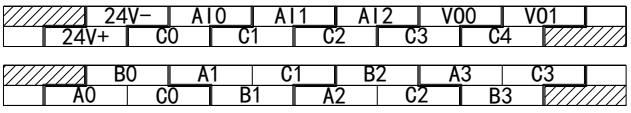
Features:
XD-E3AD4PT2DA analog expansion module converts three channels of analog input values into digital values, processes four channels of PT100 temperature signals, converts two channels of digital values into analog values, and transmits them to PLC main unit for real-time data interaction with PLC main unit.

- It has 3 channels of 14-bit precision analog input, 4-channel PT100 temperature input and 2-channel 10-bit precision analog output.
- 3-channel current 0 ~ 20mA, 4 ~ 20mA input and 2-channel voltage 0 ~ 5V, 0 ~ 10V output, set through the upper computer.
- As an extension module of XD series, XD3 series can connect up to 10 modules; XD5/XDM/XDC/XD5E/XDME series can connect up to 16 modules (not supported by XD1/XD2 series).

Specifications:

Item	Analog input (AD)	Temperature input (PT)	Analog output (DA)
	Current input (mA)		Voltage output (V)
Analog input range	0~20,4~20mA (impedance is about 120Ω)	-100~500℃	—
Max input range	-20~40mA	—	
Analog output range	—	—	0~5, 0~10V External load resistor 2KΩ~1MΩ
Digital input range	—	—	10-bit binary (0~1023)
Digital output range	14-bit binary (0~16383)	-1000~5000	—
Resolution	1/16383(14Bit)	0.1℃	1/1023(10Bit)
Integrated precision	±1%	±1% (relative max value)	±1%
Conversion speed	2ms per channel		2ms per channel
Module power supply	DC24V ±10%, 150mA		

19-2. Terminals



Channel	Terminal	Signal
CH0	AI0	0CH current input
	C0	0CH current input common terminal
CH1	AI1	1CH current input
	C1	1CH current input common terminal
CH2	AI2	2CH current input
	C2	2CH current input common terminal
CH0	A0	0CH temperature input
	B0	-
	C0	0CH input common terminal
CH1	A1	1CH temperature input
	B1	-
	C1	1CH input common terminal
CH2	A2	2CH temperature input

	B2	-
	C2	2CH input common terminal
CH3	A3	3CH temperature input
	B3	-
	C3	3CH input common terminal
CH0	VO0	0CH voltage output
	C3	0CH voltage output common terminal
CH1	VO1	1CH voltage output
	C4	1CH voltage output common terminal
-	24V	+24V power supply input
	0V	Power supply common terminal

19-3. The assignment of I/O address

XD series analog modules do not occupy I/O units; the converted data is directly transferred into PLC register.
Note: each channel can work after turning on the enable bit.

Register address of module 1:

AD channel	AD signal	Channel enable bit
0CH	ID10000	Y10000
1CH	ID10001	Y10001
2CH	ID10002	Y10002
PT channel	PT signal	Channel enable bit
0CH	ID10003	Y10003
1CH	ID10004	Y10004
2CH	ID10005	Y10005
3CH	ID10006	Y10006
DA channel	DA signal	Channel enable bit
0CH	QD10000	Y10007
1CH	QD10001	Y10010

Register address of module 2:

AD channel	AD signal	Channel enable bit
0CH	ID10100	Y10100
1CH	ID10101	Y10101
2CH	ID10102	Y10102
PT channel	PT signal	Channel enable bit
0CH	ID10103	Y10103
1CH	ID10104	Y10104
2CH	ID10105	Y10105
3CH	ID10106	Y10106
DA channel	DA signal	Channel enable bit

0CH	QD10100	Y10107
1CH	QD10101	Y10110

Register address of module 3:

AD channel	AD signal	Channel enable bit
0CH	ID10200	Y10200
1CH	ID10201	Y10201
2CH	ID10202	Y10202
PT channel	PT signal	Channel enable bit
0CH	ID10203	Y10203
1CH	ID10204	Y10204
2CH	ID10205	Y10205
3CH	ID10206	Y10206
DA channel	DA signal	Channel enable bit
0CH	QD10200	Y10207
1CH	QD10201	Y10210

Register address of module 4:

AD channel	AD signal	Channel enable bit
0CH	ID10300	Y10300
1CH	ID10301	Y10301
2CH	ID10302	Y10302
PT channel	PT signal	Channel enable bit
0CH	ID10303	Y10303
1CH	ID10304	Y10304
2CH	ID10305	Y10305
3CH	ID10306	Y10306
DA channel	DA signal	Channel enable bit
0CH	QD10300	Y10307
1CH	QD10301	Y10310

Register address of module 5:

AD channel	AD signal	Channel enable bit
0CH	ID10400	Y10400
1CH	ID10401	Y10401
2CH	ID10402	Y10402
PT channel	PT signal	Channel enable bit
0CH	ID10403	Y10403
1CH	ID10404	Y10404
2CH	ID10405	Y10405
3CH	ID10406	Y10406
DA channel	DA signal	Channel enable bit
0CH	QD10400	Y10407

1CH	QD10401	Y10410

Register address of module 6:

AD channel	AD signal	Channel enable bit
0CH	ID10500	Y10500
0CH	ID10501	Y10501
2CH	ID10502	Y10502
PT channel	PT signal	Channel enable bit
0CH	ID10503	Y10503
1CH	ID10504	Y10504
2CH	ID10505	Y10505
3CH	ID10506	Y10506
DA channel	DA signal	Channel enable bit
0CH	QD10500	Y10507
1CH	QD10501	Y10510

Register address of module 7:

AD channel	AD signal	Channel enable bit
0CH	ID10600	Y10600
1CH	ID10601	Y10601
2CH	ID10602	Y10602
PT channel	PT signal	Channel enable bit
0CH	ID10603	Y10603
1CH	ID10604	Y10604
2CH	ID10605	Y10605
3CH	ID10606	Y10606
DA channel	DA signal	Channel enable bit
0CH	QD10600	Y10607
1CH	QD10601	Y10610

Register address of module 8:

AD channel	AD signal	Channel enable bit
0CH	ID10700	Y10700
1CH	ID10701	Y10701
2CH	ID10702	Y10702
PT channel	PT signal	Channel enable bit
0CH	ID10703	Y10703
1CH	ID10704	Y10704
2CH	ID10705	Y10705
3CH	ID10706	Y10706
DA channel	DA signal	Channel enable bit
0CH	QD10700	Y10707

1CH	QD10701	Y10710

Register address of module 9:

AD channel	AD signal	Channel enable bit
0CH	ID11000	Y11000
1CH	ID11001	Y11001
2CH	ID11002	Y11002
PT channel	PT signal	Channel enable bit
0CH	ID11003	Y11003
1CH	ID11004	Y11004
2CH	ID11005	Y11005
3CH	ID11006	Y11006
DA channel	DA signal	Channel enable bit
0CH	QD11000	Y11007
1CH	QD11001	Y11010

Register address of module 10:

AD channel	AD signal	Channel enable bit
0CH	ID11100	Y11100
1CH	ID11101	Y11101
2CH	ID11102	Y11102
PT channel	PT signal	Channel enable bit
0CH	ID11103	Y11103
1CH	ID11104	Y11104
2CH	ID11105	Y11105
3CH	ID11106	Y11106
DA channel	DA signal	Channel enable bit
0CH	QD11100	Y11107
1CH	QD11101	Y11110

Register address of module 11:

AD channel	AD signal	Channel enable bit
0CH	ID11200	Y11200
1CH	ID11201	Y11201
2CH	ID11202	Y11202
PT channel	PT signal	Channel enable bit
0CH	ID11203	Y11203
1CH	ID11204	Y11204
2CH	ID11205	Y11205
3CH	ID11206	Y11206

3CH	ID11606	Y11606
DA channel	DA signal	Channel enable bit
0CH	QD11600	Y11607
1CH	QD11601	Y11610

Register address of module 16:

AD channel	AD signal	Channel enable bit
0CH	ID11700	Y11700
1CH	ID11701	Y11701
2CH	ID11702	Y11702
PT channel	PT signal	Channel enable bit
0CH	ID11703	Y11703
1CH	ID11704	Y11704
2CH	ID11705	Y11705
3CH	ID11706	Y11706
DA channel	DA signal	Channel enable bit
0CH	QD11700	Y11707
1CH	QD11701	Y11710

Note:

1. Forbid the unused channel to improve the I/O scanning speed.
2. If turn off the enable bit of the input channel, this channel will not accept the data. (the data display is 0).
3. If turn off the enable bit of the output channel, this channel will keep the former data.

19-4. Working mode

There are two ways to set the working mode:

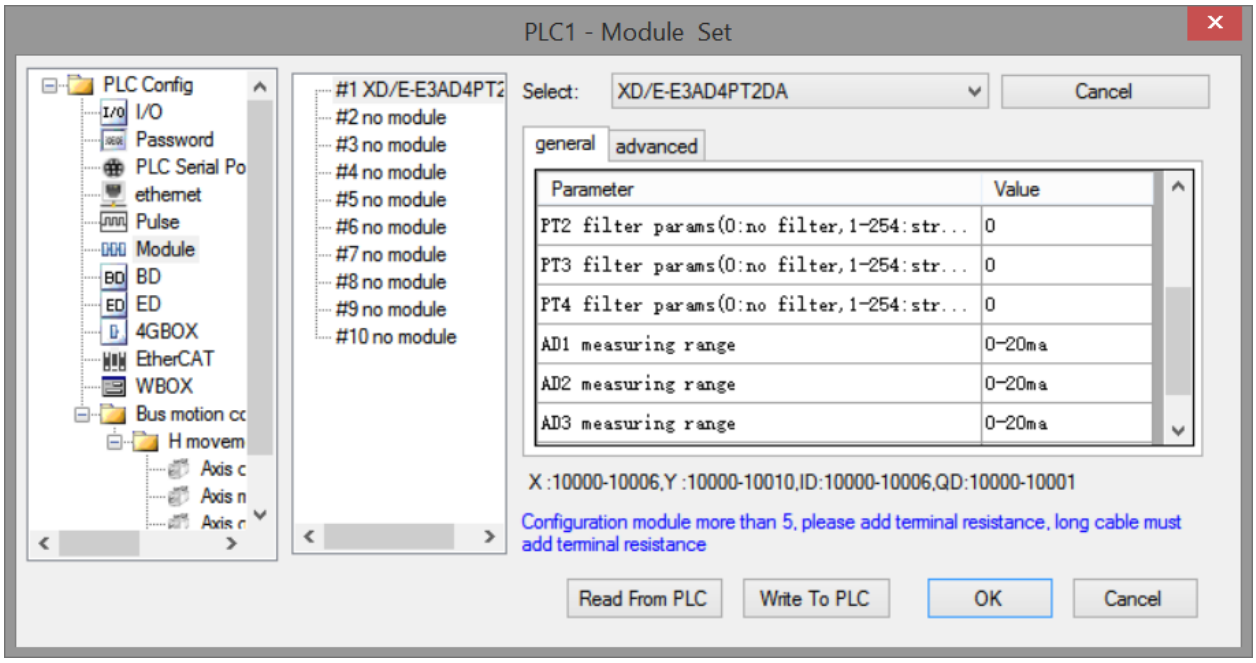
1. XDPpro software
2. Flash registers of PLC

XDPpro software:

Open the XDPpro software, click configure/expansion module settings.

Set the model and channel parameters in the following window. Then click write to PLC.

Please restart the PLC after setting.



Note:

1. first-order low-pass filter will weight present sampling value with last time filter output to get the final filter value.
2. The filter parameter range is 0 to 254, the smaller the value is, the more stable the data is, but it may cause data lag; therefore, when it is set to 1, the filtering effect is the strongest and the data is the most stable; when it is set to 254, the filtering effect is the weakest and the default is 0 (no filtering).

Flash registers:

The input channel of expansion module is current mode, and the current is 0-20mA and 4-20mA, and the output channel is voltage mode, and the voltage is 0-5V and 0-10V. It is set by special flash data register SFD in PLC. As follows:

Module no.	SFD address	Module no.	SFD address
#1	SFD350~SFD359	#9	SFD430~SFD439
#2	SFD360~SFD369	#10	SFD440~SFD449
#3	SFD370~SFD379	#11	SFD450~SFD459
#4	SFD380~SFD389	#12	SFD460~SFD469
#5	SFD390~SFD399	#13	SFD470~SFD479

#6	SFD400~SFD409	#14	SFD480~SFD489
#7	SFD410~SFD419	#15	SFD490~SFD499
#8	SFD420~SFD429	#16	SFD500~SFD509

Note: As shown in the preceding table, every register set 4 channels mode, each register has 16 bits, from low to high, every 4 bits set 1 channel mode.

SFD register bit definition:

Module no.1:

<table>
<tr><th colspan="2">Register</th><th>Bit7</th><th>Bit6</th><th>Bit5</th><th>Bit4</th><th>Bit3</th><th>Bit2</th><th>Bit1</th><th>Bit0</th><th>Note</th></tr>
<tr><td rowspan="2">SFD350</td><td>Byte0</td><td colspan="8">AD channel 0 filter parameter</td><td rowspan="3">AD filter parameter</td></tr>
<tr><td>Byte1</td><td colspan="8">AD channel 1 filter parameter</td></tr>
<tr><td rowspan="2">SFD351</td><td>Byte2</td><td colspan="8">AD channel 2 filter parameter</td></tr>
<tr><td>Byte3</td><td colspan="8">PT channel 0 filter parameter</td><td rowspan="5">PT filter parameter</td></tr>
<tr><td rowspan="2">SFD352</td><td>Byte4</td><td colspan="8">PT channel 1 filter parameter</td></tr>
<tr><td>Byte5</td><td colspan="8">PT channel 2 filter parameter</td></tr>
<tr><td rowspan="4">SFD353</td><td>Byte6</td><td colspan="8">PT channel 3 filter parameter</td></tr>
<tr><td rowspan="3">Byte7</td><td>Bit7</td><td>Bit6</td><td>Bit5</td><td>Bit4</td><td>Bit3</td><td>Bit2</td><td>Bit1</td><td>Bit0</td><td rowspan="12">Used to specify the input range of AD and DA modules, byte7 low 4-bit is the setting bit of AD channel 1, and the high 4-bit is the setting bit of AD channel 2. Byte8 low 4 bits are set for AD channel 3, and the high 4 bits are DA channel 1. The lower 4 bits of byte9 are the setting bits of DA channel 2, and the high 4 bits are reserved.</td></tr>
<tr><td colspan="4">AD2</td><td colspan="4">AD1</td></tr>
<tr><td colspan="2">-
010：0~20mA
011：4~20mA</td><td colspan="2"></td><td>-</td><td colspan="3">010：0~20mA
011：4~20mA</td></tr>
<tr><td rowspan="6">SFD354</td><td rowspan="3">Byte8</td><td>Bit7</td><td>Bit6</td><td>Bit5</td><td>Bit4</td><td>Bit3</td><td>Bit2</td><td>Bit1</td><td>Bit0</td></tr>
<tr><td colspan="4">DA1</td><td colspan="4">AD3</td></tr>
<tr><td colspan="2">-
000：0~10V
001：0~5V</td><td colspan="2"></td><td>-</td><td colspan="3">010：0~20mA
011：4~20mA</td></tr>
<tr><td rowspan="3">Byte9</td><td>Bit7</td><td>Bit6</td><td>Bit5</td><td>Bit4</td><td>Bit3</td><td>Bit2</td><td>Bit1</td><td>Bit0</td></tr>
<tr><td colspan="4"></td><td colspan="4">DA2</td></tr>
<tr><td colspan="2">-</td><td colspan="2"></td><td>-</td><td colspan="3">000：0~10V
001：0~5V</td></tr>
<tr><td colspan="2">SFD355~SFD359</td><td colspan="8">-</td></tr>
</table>

For example:

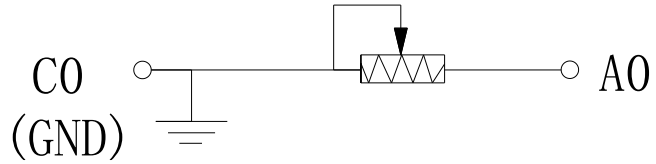
Set the module no.1 input channel 3, 2, 1, 0 working mode to 0～20mA, 4～20mA, 0～10V, 0～5V. Set the channel 1 and 2 filter factor to 254, set the channel 3 and 4 filter factor to 100. Set DA channel 1 and 0 working mode to 0~10V, 0~20mA.
So the SFD register values are:
SFD350=64FEH SFD351=4C1H SFD352=10H

19-5. Exterior connection

When make exterior connection, please read the following items:

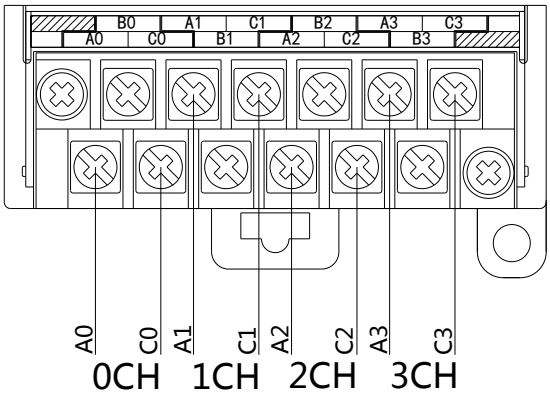
- When connect＋24V power, please choose 24V power of PLC to avoid interference.
- To avoid interference, please use shield cable and single point ground for the shield layer.

2-wire mode PT100 resistor input wiring diagram:

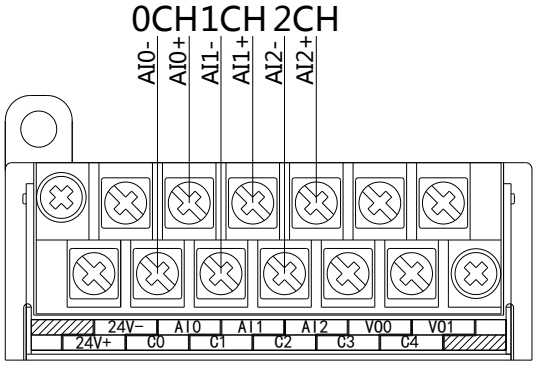


Note: the temperature input only supports two wire mode PT100 resistor input.

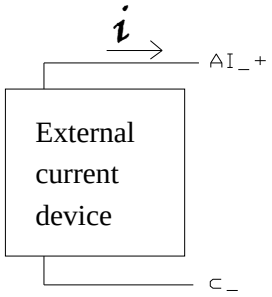
Two wire thermocouple input



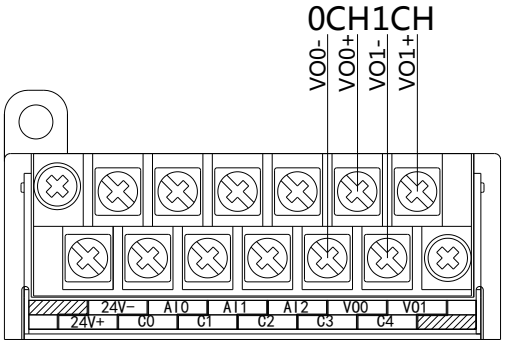
Current input



XD-E3AD4PT2DA current input wiring:

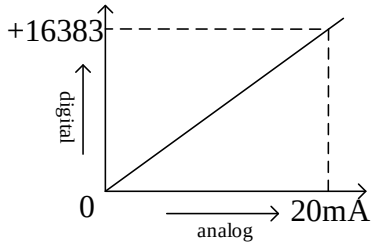


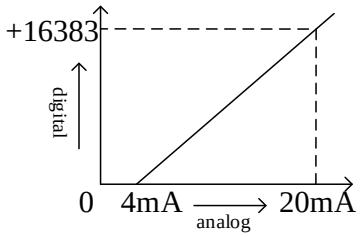
Voltage output



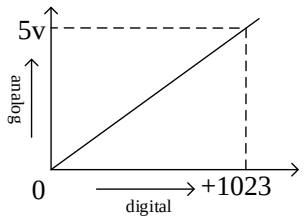
19-6. AD conversion diagram

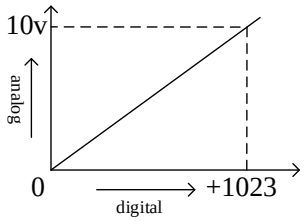
The relationship between analog input and corresponding digital value:

0-20mA analog input	4-20mA analog input
	




The relationship between input digital value and corresponding analog value:

0-5V analog output	0-10V analog output
	




Note: When input data exceeds K1023, analog output will keep the value of 5V, 10V or 20mA.

19-7. Programming

Example:

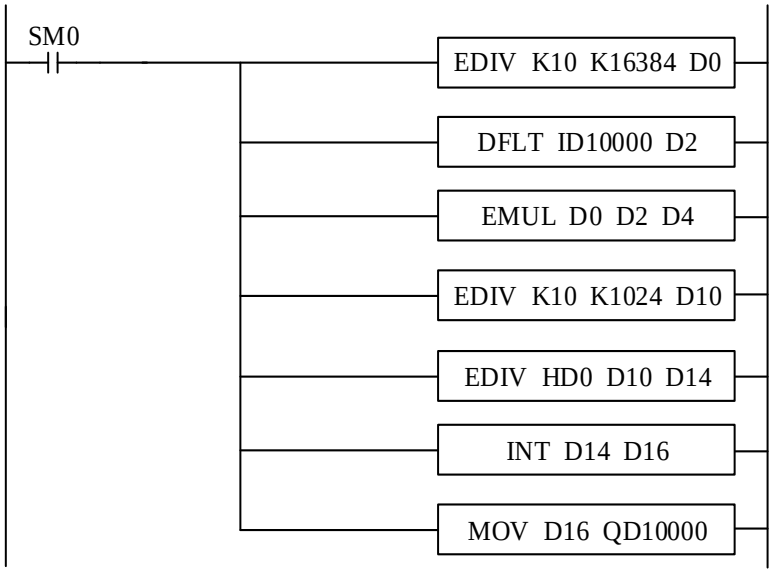
The output signal of the existing pressure sensor needs to be collected (pressure sensor performance parameters: detection pressure range 0Mp ~ 10Mp, output analog signal 4 ~ 20mA), and one channel of 0V ~ 10V voltage signal needs to be output to the inverter.

Analysis: because the pressure detection range of the pressure sensor is 0Mp ~ 10Mp, the corresponding output analog quantity is 4 ~ 20mA, and the digital quantity range of the expansion module through analog-to-digital conversion is 0 ~ 16383; therefore, we can skip the analog quantity 4 ~ 20mA of the intermediate conversion link, which directly means that the pressure detection range is 0Mp ~ 10Mp, and the corresponding digital quantity range is 0 ~ 16383; 10Mp / 16384= 0.0006103515, the real-time pressure of the current pressure sensor is the real-time value collected in the ID register of the expansion module multiplied by 0.0006103515. For example, if the digital value collected in the ID register is 4096, the corresponding pressure is 2.5Mp.

Similarly, the range of digital value set in the register QD of the expansion module is 0 ~ 1023, which corresponds to the voltage output signal 0V ~ 10V, and 10V / 1024 = 0.0097656, which indicates how much voltage value is output for each digital value set in the register QD of the expansion module. For example, 3V voltage value needs to be output now, 3V / 0.0024414 = 307, and the calculated digital value is sent to the corresponding QD register.

Note: please use floating-point number for calculation, otherwise the calculation accuracy will be affected or even unable to calculate!

Program:



Explanation:

SM0 is normally on coil, which is always on during PLC operation.

When PLC starts to run, analog quantity acquisition first calculates the pressure value corresponding to each digit 1 of the digital quantity collected by the expansion module, and then converts the digital quantity (integer) collected in ID10000 register into floating-point number. So the real-time value collected in ID10000 register of the expansion module is multiplied by the pressure value corresponding to each digit 1 of the digital quantity collected by the expansion module, it can be calculated the collected real-time pressure value.

Similarly, the analog output first calculates the voltage value corresponding to each digit 1 of the digital quantity collected by the expansion module, then divides the set target voltage value by it to get the set digital value (floating point number). Since QD10000 register can only store integers, it is necessary to convert the floating-point number to integer and send to QD10000.

Note: please turn on the enable bit of the used channel, that is, set Y10000 and Y1007 to on.

20. X-NET relay module JR-EH

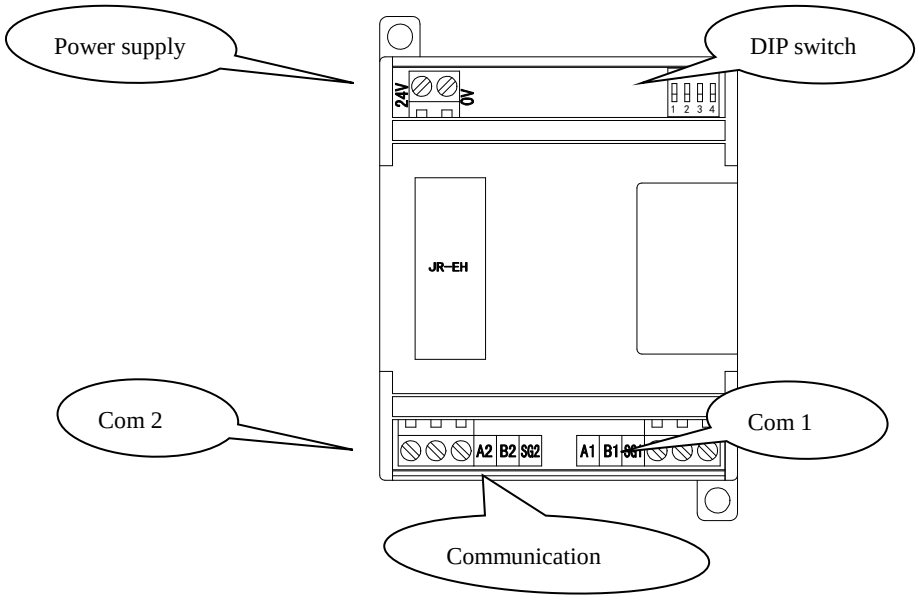
20-1. Suitable condition

JR-EH is X-NET relay module which fit for RS485 communication. The signal will be affected and bit error rate will rise when system baud rate is high, and there are many nodes or the distance is long. This module is recommended to improve the communication quality.

20-2. Features

Item	Parameter
Power supply	DC24V ±10%
Temperature/humidity	-15~65℃, 5%~95% no condensation
Standard	Accords to IEC-61000-4-2, IEC61000-4-4, IEC61000-4-5
Max load numbers	32
Baud rate	9600bps~3Mbps

20-3. Appearance



Com1 and com2 has no master and slave, they can be wiring as needs. Terminal A, B is for RS485, SG is ground terminal.

20-4. Baud rate

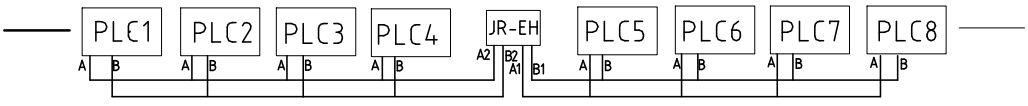
DIP switch	Baud rate	DIP switch	Baud rate
0000	Self-adaption	1000	256K
0001	9.6K	1001	288K
0010	19.2K	1010	384K
0011	28.8K	1011	512K
0100	38.4K	1100	576K
0101	57.6K	1101	768K
0110	115.2K	1110	1M
0111	192K	1111	3M

The two devices communicate with the same baud rate when the module is in self-adaption mode, the relay will lock the baud rate in 1 second and transfer the data. If the device communication has error, the relay will fail to lock the baud rate. We suggest user to choose fixed baud rate, user can use self-adaption mode if the baud rate is not listed in the above table.

20-5. LED

When the module is in self-adaption mode, LED always ON means the baud rate has been locked, LED OFF means it has not been locked.
When the module is in fixed baud rate state, LED flickering means the communication is normal, LED always ON means the communication has error.

20-6. Wiring diagram



Please use the shielded twisted pair accords to EIA-485, resistor is 120ohm.

The relationship between baud rate and communication distance

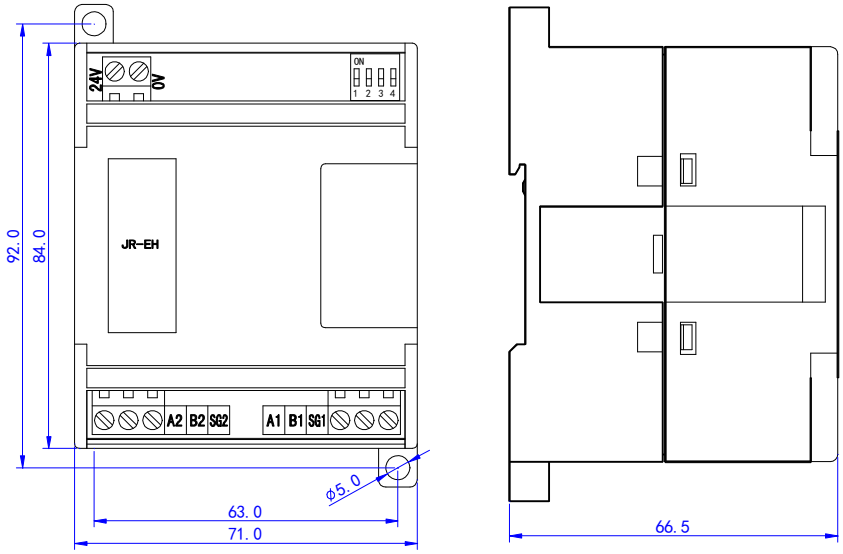
Baud rate	Max distance
9.6-187.5Kbit/s	1000m
500Kbit/s	400m
1.5Mbit/s	200m
3Mbit/s	100m

20-7. Module naming rule

J	R	-	E	H
∧	∧		∧	∧
Module type	Repeater		RS485	High speed

20-8. Dimension

Unit:mm



XINJE

KALATEC
AUTOMAÇÃO
